

# H-Bridge Driver

The 33186 is a monolithic H-Bridge ideal for fractional horsepower DC-motor and bi-directional thrust solenoid control. The IC incorporates internal control logic, charge pump, gate drive, and low  $R_{DS(ON)}$  MOSFET output circuitry. The 33186 is able to control continuous inductive DC load currents up to 5.0 A. Output loads can be pulse width modulated (PWM-ed) at frequencies up to 10 kHz.

The 33186 is parametrically specified over a temperature range of  $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ ,  $5.0\text{ V} \leq V+ \leq 28\text{ V}$ . The IC can also be operated up to 40 V with de-rating of the specifications. The IC is available in a surface mount power package with exposed pad for heat sinking.

## Features

- Overtemperature, Short-Circuit Protection, and Overvoltage Protection against Transients up to 40 V at VBAT Typical
- $R_{DSon} = 150\text{ m}\Omega$  for each output Transistor at  $25^{\circ}\text{C}$
- Continuous DC Load Current 5 A ( $T_C < 100^{\circ}\text{C}$ )
- Output Current Limitation at typ 6,5 A +/- 20%
- Short-Circuit Shutdown for Output Currents over 8 A
- Logic Inputs TTL/CMOS Compatible
- Operating Frequency up to 20 kHz
- Undervoltage Disable Function
- Diagnostic Output, 2 Disable Input
- Coding Input for Alternative Functions
- Stable Operation with an External Capacitance of Maximum 47  $\mu\text{F}$  at VBAT
- Pb-Free Packaging Designated by Suffix Code VW

## PIN CONNECTIONS

## PIN CONNECTIONS

Figure 3. 33186 Pin Locations

Table 1. 33186 Pin Description

Pin	Name	Description
9, 10, 11, 12 Metal slug	PGND	Power Ground. All the ground are connected together, they should be connected as short as possible on the PCB.
1	AGND	Analog ground. All the ground are connected together, they should be connected as short as possible on the PCB.
2	Output Status flag (SF)	Open drain output, active low. Is set according to the truth table. When a fault appears, SF changes typically in less than 100 ms.
3,13 18, 19	Inputs IN1, IN2, DI1, DI2, COD	Voltage controlled inputs with hysteresis
8	COD	When not connected or connected to GND, a stored failure will be reset by change of the voltage-level on DI1 or DI2. When connected to VCC, the disable Pin DI1 and DI2 are inactive. A stored failure will be reset by change of the voltage-level on IN1 or IN2.
6, 7, 14, 15	OUT1, OUT2	H-Bridge outputs with integrated free-wheeling diodes.

**Table 1. 33186 Pin Description(continued)**

Pin	Name	Description
4, 5, 16	VBAT	<p>The Pins 4 and 5 are internally connected. These Pins supply the left high side and the analog/logic part of the device.</p> <p>The Pin 16 supplies the right high side and the charge pump.</p> <p>The Pins 4, 5 and 16 should be connected together on the printed circuit board with connections as short as possible.</p> <p>Supervision and protection functions</p> <p>a) Supply voltage supervision</p> <p>The supply voltage is supervised. If it is below its specific threshold, the power stages are switched in tristate and the status flag is switched low.</p> <p>If the supply voltage is over the specific threshold again, the power stage switches independently into normal operation, according to the input Pins and the status flag is reset.</p> <p>b) Thermal supervision</p> <p>In case of overtemperature, the power stages are switched in tristate independent of the inputs signals and the status flag is switched low.</p> <p>If the level changes from high to low on DI1 (IN1) or low to high on DI2 (IN2), the output stage switches on again if the temperature is below the specified limit. The status-flag is reset to high level (Pin names in brackets refer to coding Pin = VCC).</p> <p>c) <i>Supervision of overcurrent on high sides and low sides</i></p> <p>In case of over-current detection, the power stages are switched in tristate independent of the inputs signals and the status flag is set.</p> <p>If the level changes from high to low on DI1 (IN1) or low to high on DI2 (IN2) the output stage switches on again and the status flag is reset to high level (Pin names in brackets refer to coding Pin = VCC).</p> <p>The output stage switches into the mode defined by the inputs Pins provided, and/if the temperature is below the specified limits.</p> <p>d) Current limiting on low sides</p> <p>The maximum current which can flow under normal operating conditions is limited to <math>I_{max} = 6,5 \text{ A} \pm 20\%</math>. When the maximum current value is reached, the output stages are switched tristate for a fixed time. According to the time constant the current decreases until the next switch on occurs. See page 8 for schematics.</p>
17	CP	<p>Charge Pump output Pin</p> <p>A filtering capacitor (up to 33 nF) can be connected between Pin 17 and Gnd. Device can operate without external capacitor, although Pin 17 decoupling capacitor help in noise reduction and allows the device to perform a maximum speed, timing and PWM frequency.</p>

## ELECTRICAL CHARACTERISTICS

## MAXIMUM RATINGS

Table 2. MAXIMUM RATINGS

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Ratings	Symbol	Min	Typ	Max	Unit
---------	--------	-----	-----	-----	------

## ELECTRICAL RATINGS

Supply Voltage					V
Static Destruction Proof	$V_{BAT}$	- 1.0	–	28	
Dynamic Destruction Proof $t < 0,5$ s	$V_{Bat}$	- 2.0	–	40	
Logic Inputs (IN1, IN2, DI1, DI2, CODE)	U	- 0.5	–	7.0	V
Output Status - Flag SF	$U_{SF}$	- 0.5	–	7.0	V

## THERMAL RATINGS

Junction Temperature	$T_J$	- 40	–	+150	°C
Storage Temperature	$T_S$	- 55	–	+125	°C
Ambient Temperature	$T_A$	- 40	–	+125	°C
Thermal Resistance (with power applied on 2 power MOS)	$R_{th_{JC}}$	–	–	+1.5	K/W
Thermal Resistance (with power applied on 2 power MOS)	$R_{th_{JC}}$	–	–	+1.5	K/W
Peak Package Reflow Temperature During Reflow <sup>(1), (2)</sup>	$T_{PPRT}$	Note 2.			°C

## Notes

- Pin soldering temperature limit is for 10 seconds maximum duration. Not designed for immersion soldering. Exceeding these limits may cause malfunction or permanent damage to the device.
- Freescale's Package Reflow capability meets Pb-free requirements for JEDEC standard J-STD-020C. For Peak Package Reflow Temperature and Moisture Sensitivity Levels (MSL), Go to [www.freescale.com](http://www.freescale.com), search by part number [e.g. remove prefixes/suffixes and enter the core ID to view all orderable parts. (i.e. MC33xxxD enter 33xxx), and review parametrics.

### STATIC ELECTRICAL CHARACTERISTICS

**Table 3. STATIC ELECTRICAL CHARACTERISTICS**

Characteristic noted under conditions -40°C to +125 °C, VBAT from 5 V to 28 V, unless otherwise note. Typical values reflect approximate mean at 25°C, nominal VCC, at time of device characterization.

Characteristics	Symbol	Min	Typ	Max	Unit
-----------------	--------	-----	-----	-----	------

#### POWER SUPPLY

Operating Range:					
Static	$V_{BAT}$	5.0	–	28	V
Dynamic (t < 500 ms)	$V_{BAT}$	–	–	40	V
Stand-by current f = 0 to 10 KHz; IOU = 0 A	$I_{VBAT}$	–	–	35	mA
VBAT-undervoltage switch-off (without load)					
Switch-off Voltage		4.15	4.4	4.65	V
Switch-on Voltage		4.5	4.75	5.0	V
Hysteresis		150	–	–	mV

#### CHARGE-PUMP SUPPLY

VBAT = 4.15 V	$V_{CP} - V_{BAT}$	3.35	–	–	V
VBAT < 40 V	$V_{CP} - V_{BAT}$	–	–	20	V

#### LOGIC INPUTS

Input High	VINH	3.4	–	–	V
Input Low	VINL	–	–	1.4	V
Input Hysteresis	U	0.7	1.0	–	V
Input Pull Up Current (IN1, IN2, DI1) UIN = 0.0 V	I	- 200	- 80	–	μA
Input Pull Down Current (DI2,COD) <sup>(3)</sup> UDI2 = 5.0 V	$I_{DI2}$	–	25	100	μA

#### POWER OUTPUTS: OUT1, OUT2

Switch on resistance: $R_{OUT - VBAT}$ ; $R_{OUT - GND}$ VBAT = 5 to 28 V; CCP = 0 to 33 nF		–	–	300	mΩ
Switch-off Current during Current Limitation on Low Sides	(IOU) MAX	5.2	6.5	7.8	A
Switch-off Time during Current Limitation on Low Sides	$t_A$	15	20.5	26	μs
Blanking Time during Current Limitation on Low Sides	$t_B$	12	16.5	21	μs

#### Notes

- In case of negative voltage at OUT2 (respectively OUT1) this maximum pull down current at DI2 (respectively COD) Pin can be exceeded. This happens during recirculation when the current is flowing in the low side. See curve 22.

**Table 3. STATIC ELECTRICAL CHARACTERISTICS(continued)**

Characteristic noted under conditions -40°C to +125 °C, VBAT from 5 V to 28 V, unless otherwise note. Typical values reflect approximate mean at 25°C, nominal VCC, at time of device characterization.

Characteristics	Symbol	Min	Typ	Max	Unit
High Side Overcurrent Detection <sup>(4)</sup>	I <sub>OCHS</sub>	11	–	–	A
Low Side Overcurrent Detection	I <sub>OCLS</sub>	8.0	–	–	
Leakage Current Output Stage Switched off		–	–	100	μA
Free-Wheeling Diode Forward Voltage IOU = 3.0 A	U <sub>D</sub>	–	–	2.0	V
Free-Wheeling Diode Reverse Recovery Time IFM =1.0 A, di/dt = 4.0 A/μs	t <sub>RR</sub>	–	2.0	5.0	μs
Switch-off Temperature		160	–	190	°C
Hysteresis		20	–	30	°C

**OUTPUT STATUS FLAG (OPEN DRAIN OUTPUT)**

Output High (SF not set) USF = 5.0 V	I <sub>SF</sub>	–	–	10	μA
Output Low (SF set) ISF = 300 μA	V <sub>SF</sub>	–	–	1.0	V

**TIMING**

PWM frequency CCP = 33 nF	f	–	–	10	KHz
Maximum Switching Frequency During Current Limitation VBAT = 6....28 V.....C <sub>CP</sub> = 33 nF	f	–	–	20	KHz
Output ON Delay IN1.....>OUT1 or IN2.....>OUT2	t <sub>DON</sub>	–	–	15	μs
Output OFF Delay IN1.....>OUT1 or IN2.....>OUT2	t <sub>DOFF</sub>	–	–	15	μs
Output Switching Time CCP = 0 to 33 nF OUTiH.....OUTiL, OUTiL.....OUTiH, IOU = 3.0 A	t <sub>r</sub> , t <sub>f</sub>	2.0	–	5.0	μs
Disable Delay Time Dli.....OUTi	t <sub>DDIS</sub>	–	–	8.0	μs
Turn off in Case of Overcurrent or Overtemperature		–	4.0	8.0	μs
Power On Delay Time (CCP = 33 nF) <sup>(5)</sup>		–	1.0	5.0	ms

Notes

- In case of overcurrent, the time when the current is greater than 7.8 A is lower than 30 μs, with a maximum frequency of 1 kHz.
- This parameter corresponds to the time for CCP to reach its nominal value when VBAT is applied.

**TRUTH TABLE**

**Table 4. TRUTH TABLE**

Device State	Input Conditions				Status		Outputs	
	DI1 <sup>(8)</sup>	DI2 <sup>(8)</sup>	IN1	IN2	SF <sup>(9)</sup>	SF <sup>(10)</sup>	OU1	OU2
1-Forward	L	H	H	L	H	H	H	L
2-Reverse	L	H	L	H	H	H	L	H
3-Free Wheeling Low	L	H	L	L	H	H	L	L
4-Free Wheeling High	L	H	H	H	H	H	H	H
5-Disable 1	H	X	X	X	L	H	Z	Z
6-Disable 2	X	L	X	X	L	H	Z	Z
7-IN1 Disconnected	L	H	Z	X	H	H	H	X
8-IN2 Disconnected	L	H	X	Z	H	H	X	H
9-DI1 Disconnected	Z	X	X	X	L	H	Z	Z
10-DI2 Disconnected	X	Z	X	X	L	H	Z	Z
11-Current Limit.active	L	H	X	X	H	H	Z	Z
12-Undervoltage <sup>(6)</sup>	X	X	X	X	L	L	Z	Z
13-Overtemperature <sup>(7)</sup>	X	X	X	X	L	L	Z	Z
14-Overcurrent <sup>(7)</sup>	X	X	X	X	L	L	Z	Z

**Notes**

6. In case of undervoltage, tristate and status-flag are reset automatically.
7. Whenever overcurrent or overtemperature is detected, the fault is stored (i.e.status-flag remains low). The tristate conditions and the status-flag are reset via DI1 (IN1) or DI2 (IN2). Pin names in brackets refer to coding Pin (COD = VCC).
8. If COD = VCC then DI1 and DI2 are not active.
9. COD = nc or GND
10. COD = VCC

L = Low  
H = High  
X = High or Low  
Z = High impedance (all output stage transistors are switched off).

## PACKAGING

### SOLDERING

The 20 HSOP package is designed for enhanced thermal performance. The particularity of this package is its copper base plate on which the power die is soldered. The base plate is soldered on a PCB to provide heat flow to the ambient and also to provide a large thermal capacitance.

Of course, the more copper area on the PCB, the better the power dissipation and transient behavior.

We characterized the 20 HSOP on a double side PCB. The bottom side area of the copper is  $7.8 \text{ cm}^2$ . The top surface is  $2.7 \text{ cm}^2$ , see [Figure 26](#).

Bottom Side

**Figure 26. PCB Test Layout**

**Figure 27. PHSOP20 Thermal Response**

[Figure 27](#) shows the thermal response with the device soldered on to the test PCB described on [Figure 26](#).

## ADDITIONAL DOCUMENTATION

### THERMAL ADDENDUM (REV 2.0)

#### Introduction

This thermal addendum is provided as a supplement to the MC33186 technical datasheet. The addendum provides thermal performance information that may be critical in the design and development of system applications. All electrical, application, and packaging information is provided in the datasheet.

#### Package and Thermal Considerations

The MC33186 is offered in a 20 pin HSOP exposed pad, single die package. There is a single heat source (P), a single junction temperature ( $T_J$ ), and thermal resistance ( $R_{\theta JA}$ ).

$$\{ T_J \} = [ R_{\theta JA} ] \cdot \{ P \}$$

The stated values are solely for a thermal performance comparison of one package to another in a standardized environment. This methodology is not meant to and will not predict the performance of a package in an application-specific environment. Stated values were obtained by measurement and simulation according to the standards listed below.

Standards

**Table 5. Thermal Performance Comparison**

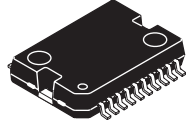

Thermal Resistance	[°C/W]
$R_{\theta JA}$ (1), (2)	29
$R_{\theta JB}$ (2), (3)	9.0
$R_{\theta JA}$ (1), (4)	69
$R_{\theta JC}$ (5)	2.0

Notes:

1. Per JEDEC JESD51-2 at natural convection, still air condition.
2. 2s2p thermal test board per JEDEC JESD51-5 and JESD51-7.
3. Per JEDEC JESD51-8, with the board temperature on the center trace near the center lead.
4. Single layer thermal test board per JEDEC JESD51-3 and JESD51-5.
5. Thermal resistance between the die junction and the exposed pad surface; cold plate attached to the package bottom side, remaining surfaces insulated.
