1. Overview

1.1 Features

The RX610 Group is an MCU with the high-speed, high-performance RX CPU as its core.

One basic instruction is executable in one cycle of the system clock. Calculation functionality is further enhanced, with the inclusion of a single-precision floating-point calculation unit as well as a 32-bit multiplier and divider. Additionally, code efficiency is improved by instructions with lengths that are variable in byte units and by an enhanced range of addressing modes.

Timers, serial communication interfaces, I^2C bus interfaces, an A/D converter, and a D/A converter are incorporated as peripheral functions which are essential to embedded devices.

Facilities for connecting external memory are also included, enabling direct connection to memory and peripheral LSI circuits. The on-chip memory is flash memory capable of large-capacity, high-speed operation, and this significantly reduces the cost of configuring systems.

1.1.1 Applications

Office automation equipment and digital industrial equipment

1.1.2 Outline of Specifications

Table 1.1 lists the specifications of the RX610 Group in outline.

Table 1.1 Outline of Specifications

Classification	Module/Function	Description
CPU	CPU	• Maximum operating frequency: 100 MHz • 32-bit RX CPU • Minimum instruction execution time: One instruction in one state (in one system clock cycle) • Address space: 4-Gbyte linear address • Register set of the CPU General purpose: Sixteen 32-bit registers Control: Nine 32-bit registers Accumulator: One 64-bit register • Basic instructions: 73 • Floating-point operation instructions: 8 • DSP instructions: 9 • Addressing modes: 10 • Data arrangement Instructions: Little endian Data: Selectable as little endian or big endian • On-chip 32-bit multiplier: 32 x 32 → 64 bits • On-chip divider: 32 / 32 → 32 bits • Barrel shifter: 32 bits
	FPU	• Single precision (32-bit) floating point • Data types and floating-point exceptions conforming to the IEEE754 standard
Memory	Flash	• Flash capacity: 2 Mbytes (max.) • Three types of on-board programming modes SCI boot mode, user program mode, and user boot mode
	RAM	RAM capacity: 128 Kbytes
	Data flash	Data flash capacity: 32 Kbytes
MCU operating modes		Single-chip mode, on-chip ROM enabled extended mode, and on-chip ROM disabled extended mode
Clock	Clock generation circuit	• One main clock oscillation circuit • Includes a PLL circuit and frequency divider, so the operating frequency is selectable • System clock, peripheral module clock, and external bus clock are independently specifiable. The CPU, DMAC, DTC, ROM, and RAM run in synchronization with the system clock (ICLK): 8 to 100 MHz Peripheral modules run in synchronization with the peripheral module clock (PCLK): 8 to 50 MHz Devices connected to the external bus run in synchronization with the external bus clock (BCLK): 8 to 25 MHz
Power down	Power-down function	• Module stop function • Four power-down modes Sleep mode, all-module clock stop mode, software standby mode, and deep software standby mode

Classification	Module/Function	Description
Interrupt	Interrupt control unit	• Peripheral function interrupts: 116 • External interrupts: 16 (pins IRQ15 to IRQ0) • Non-maskable interrupt: 1 (the NMI pin) • Eight priority orders specifiable
External bus extension		• The external address space can be divided into eight areas (CS0 to CS7), each of which is independently controllable. Capacity of each area: 16 Mbytes Chip-select signals (CS0# to CS7#) can be output for each area. 8-bit or 16-bit bus space can be specified for each area. The data arrangement is selectable as little endian or big endian for each area. (only for data) • Separate bus system • Wait control • Write buffer programming
DMA	DMA controller	• 4-channel DMA transfer available • Activation sources: Software trigger, external interrupts, and interrupt requests from peripheral functions
	Data transfer controller	• Three transfer modes: Normal transfer, repeat transfer, and block transfer • Activated by interrupt requests (chain transfer enabled)
I/O ports	Programmable I/O ports	• I/O pins: 117 (144-pin LQFP), 140 (176-pin LFBGA) • Pull-up resistors: 40 • Open-drain outputs: 16 • 5-V tolerance: 10
Timer	16-bit timer pulse unit	• (16 bits x 6 channels) x 2 units • Up to 16 pulse inputs and outputs • Select from among 7 or 8 counter-input clocks for each channel • Input capture/output compare function • Maximum of 15-phase PWM output possible in PWM mode • Buffered operation, phase counting mode (two-phase encoder input), and cascaded operation (32 bits x 2 channels) settable for each channel • PPG output trigger can be generated • Conversion start trigger for the A/D converter can be generated
	Programmable pulse generator	• (4 bits x 4 groups) x 2 units • Provides pulse outputs by using the TPU output as a trigger • Maximum of 32-bit pulse output possible
	8-bit timer	• (8 bits x 2 channels) x 2 units • Select from among 8 clock sources (7 internal clocks and 1 external clock) • Allows the output of pulse trains with a desired duty cycle or PWM signals • Cascading of 2 channels enables it to be used as a 16-bit timer • Generation of trigger to start A/D converter conversion • Capable of generating baud rate clock for SCI5 and SCI6
	Compare match timer	• (16 bits x 2 channels) x 2 units • Select from among 4 counter-input clocks

Classification	Module/Function	Description
Watchdog timer		• 8 bits x 1 channel • Select from among 8 counter-input clocks • Switchable between watchdog timer mode and interval timer mode
Communication function	Serial communication interface	• 7 channels • Serial communication mode: Asynchronous, clock synchronous, and smart card interface • On-chip baud rate generator allows any bit rate to be selected • Choice of LSB-first or MSB-first transfer • Enables average transfer rate clock input from TMR (SCI5, SCI6)
	I^2C bus interface	• 2 channels • Communication format I^2C bus format/SMBus format Master/slave selectable (For multi-master operation) • Maximum transfer rate: 1 Mbps
A/D converter		• 4 units (1 unit x 4 channels) • 10-bit resolution • Conversion time: 1.0 μs per channel (at 50-MHz (PCLK) operation) • Two kinds of operating modes Single mode and scan mode (single scan mode or continuous scan mode) • Sample-and-hold function • Three types of A/D conversion start Conversion can be started by software, a conversion start trigger by the timer (TPU or TMR), or an external trigger signal.
D/A converter		• 2 channels • 10-bit resolution • Output voltage: 0 V to VREFH
CRC calculator		• CRC code generation for arbitrary data lengths in 8-bit units • One of three generating polynomials selectable $X^8 + X^2 + X + 1$, $X^{16} + X^{15} + X^2 + 1$, $X^{16} + X^{12} + X^5 + 1$ • CRC code generation for LSB-first or MSB-first communication selectable
Operating frequency		8 to 100 MHz
Power supply voltage		V_{CC} = $PLLV_{CC}$ = AV_{CC} = 3.0 to 3.6V, VREFH = 3.0 to AV_{CC}
Supply current		50 mA (typ.) (regular specifications)
Operating temperature		–20 to +85 C (regular specifications), –40 to +85 C (wide-range specifications)
Package		176-pin LFBGA (PLBG0176GA-A) 144-pin LQFP (PLQP0144KA-A)

1.2 List of Products

1.5 Pin Functions

Table 1.5 lists the pin functions.

Table 1.5 Pin Functions

Classifications	Pin Name	I/O	Description
Power supply	VCC	Input	Power supply pin. Connect it to the system power supply.
	VCL	Input	Connect this pin to VSS via a 0.1-μF capacitor. The capacitor should be placed close to the pin.
	VSS	Input	Ground pin. Connect it to the system power supply (0 V).
	PLLVCC	Input	Power supply pin for the PLL circuit. Connect it to the system power supply.
	PLLVSS	Input	Ground pin for the PLL circuit
Clock	XTAL	Input	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	BCLK	Output	Outputs the system clock for external devices.
Operating mode control	MD0, MD1, MDE	Input	Pins for setting the operating mode. The signal levels on these pins must not be changed during operation.
System control	RES#	Input	Reset signal input pin. This LSI enters the reset state when this signal goes low.
	EMLE	Input	Input pin to enable on-chip emulator signal. When the on-chip emulator is used, this pin should be driven high. When not used, it should be driven low.
	BSCANP	Input	Input pin to enable boundary-scan signal. When this pin is driven high, the boundary scan is enabled. When the boundary scan is not used, this pin should be driven low.
On-chip emulator	TRST#	Input	On-chip emulator pins. When the EMLE pin is driven high, these pins are dedicated for the on-chip emulator.
	TMS	Input	
	TDI	Input	
	TCK	Input	
	TDO	Output	
	TRCLK	Output	This pin outputs the clock for synchronization with the trace data.
	TRSYNC	Output	This pin indicates that output from the TRDATA0 to TRDATA3 pins is valid.
	TRDATA0 to TRDATA3	Output	These pins output the trace information.
Address bus	A0 to A23	Output	Output pins for the address
Data bus	D0 to D15	I/O	Input and output pins for the bidirectional data bus

Classifications	Pin Name	I/O	Description
Bus control	RD#	Output	Strobe signal which indicates that reading from the external bus interface space is in progress.
	WR0#	Output	Strobe signal which indicates that the lower-order byte (D0 to D7) is valid in writing to the external bus interface space, in byte strobe mode.
	WR1#	Output	Strobe signal which indicates that the higher-order byte (D8 to D15) is valid in writing to the external bus interface space, in byte strobe mode.
	WR#	Output	Strobe signal which indicates that writing to the external bus interface space is in progress, in 1-write strobe mode.
	BC0#	Output	Strobe signal which indicates that the lower-order byte (D0 to D7) is valid in access to the external bus interface space, in 1-write strobe mode.
	BC1#	Output	Strobe signal which indicates that the higher-order byte (D8 to D15) is valid in access to the external bus interface space, in 1- write strobe mode.

16-bit timer pulse unit	TIOCA0, TIOCB0 TIOCC0, TIOCD0	I/O	Signals for TGRA0 to TGRD0. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA1, TIOCB1	I/O	Signals for TGRA1 and TGRB1. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA2, TIOCB2	I/O	Signals for TGRA2 and TGRB2. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA3, TIOCB3 TIOCC3, TIOCD3	I/O	Signals for TGRA3 to TGRD3. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA4, TIOCB4	I/O	Signals for TGRA4 and TGRB4. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA5, TIOCB5	I/O	Signals for TGRA5 and TGRB5. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA6, TIOCB6 TIOCC6, TIOCD6	I/O	Signals for TGRA6 to TGRD6. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA7, TIOCB7	I/O	Signals for TGRA7 and TGRB7. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA8, TIOCB8	I/O	Signals for TGRA8 and TGRB8. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA9, TIOCB9 TIOCC9, TIOCD9	I/O	Signals for TGRA9 to TGRD9. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA10, TIOCB10	I/O	Signals for TGRA10 and TGRB10. These pins are used as input capture inputs, output compare outputs, or PWM outputs.
	TIOCA11, TIOCB11	I/O	Signals for TGRA11 and TGRB11. These pins are used as input capture inputs, output compare outputs, or PWM outputs.

Classifications	Pin Name	I/O	Description
Analog power supply	AVCC	Input	Analog power supply pin for the A/D and D/A converters. When the A/D and D/A converters are not in use, connect this pin to the system power supply.
	AVSS	Input	Ground pin for the A/D and D/A converters. Connect this pin to the system power supply (0 V).
	VREFH	Input	Reference power supply pin for the A/D and D/A converters. When the A/D and D/A converters are not in use, connect this pin to the system power supply.
	VREFL	Input	Reference ground pin for the A/D and D/A converters. Make sure to connect this pin to the analog reference power supply (0 V). When the A/D and D/A converters are not in use, connect this pin to the system power supply (0 V). For details, see section 23.6.7, Ranges of Settings for Analog Power Supply and Other Pins.

2. CPU

The RX CPU has sixteen general-purpose registers, nine control registers, and one accumulator used for DSP instructions.

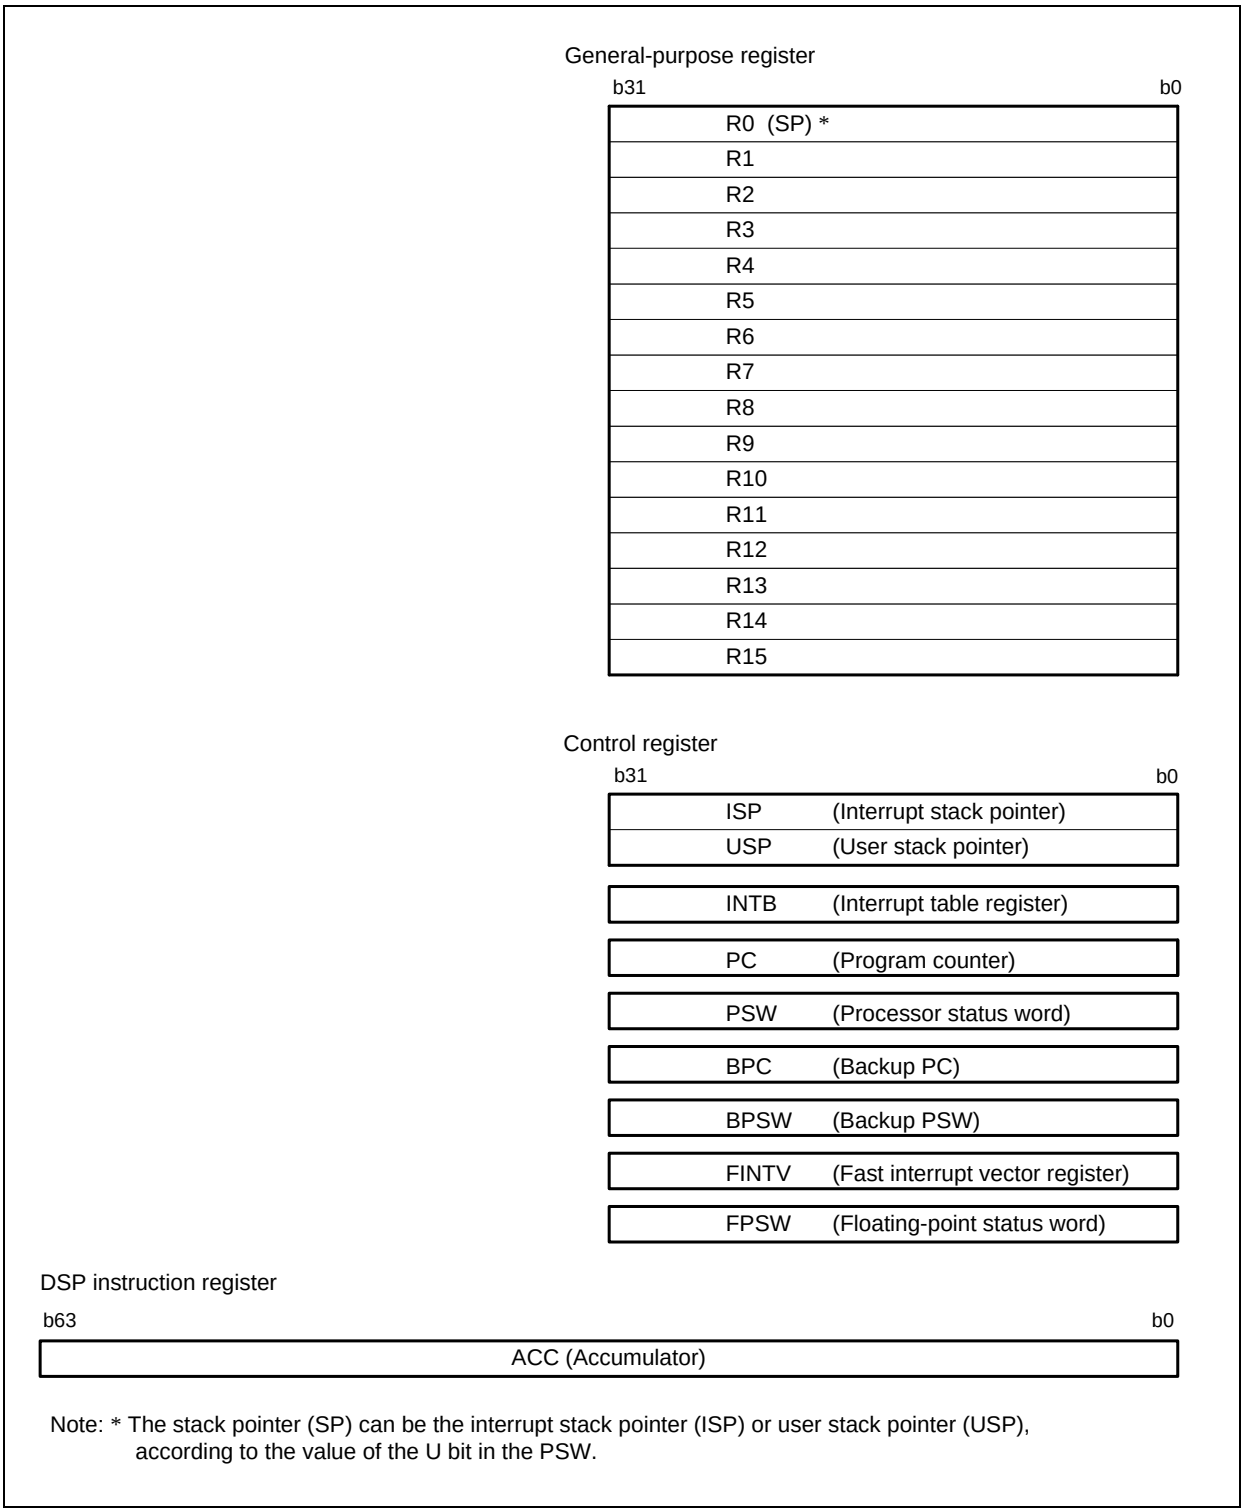

Figure 2.1 Register Set of the CPU

2.1 General-Purpose Registers (R0 to R15)

This CPU has sixteen general-purpose registers (R0 to R15). R1 to R15 can be used as data registers or address registers.

R0, a general-purpose register, also functions as the stack pointer (SP). The stack pointer is switched to operate as the interrupt stack pointer (ISP) or user stack pointer (USP) by the value of the stack pointer select bit (U) in the processor status word (PSW).

2.2 Control Registers

(1) Interrupt Stack Pointer (ISP)/User Stack Pointer (USP)

The stack pointer (SP) can be either of two types, the interrupt stack pointer (ISP) or the user stack pointer (USP). Whether the stack pointer operates as the ISP or USP depends on the value of the stack pointer select bit (U) in the processor status word (PSW).

Set the ISP or USP to a multiple of four, as this reduces the numbers of cycles required to execute interrupt sequences and instructions entailing stack manipulation.

(2) Interrupt Table Register (INTB)

The interrupt table register (INTB) specifies the address where the relocatable vector table starts.

Set INTB to a multiple of four.

(3) Program Counter (PC)

The program counter (PC) indicates the address of the instruction being executed.

(4) Processor Status Word (PSW)

The processor status word (PSW) indicates results of instruction execution or the state of the CPU.

(5) Backup PC (BPC)

The backup PC (BPC) is provided to speed up response to interrupts.

After a fast interrupt has been generated, the contents of the program counter (PC) are saved in the BPC.

(6) Backup PSW (BPSW)

The backup PSW (BPSW) is provided to speed up response to interrupts.

After a fast interrupt has been generated, the contents of the processor status word (PSW) are saved in the BPSW. The allocation of bits in the BPSW corresponds to that in the PSW.

(7) Fast Interrupt Vector Register (FINTV)

The fast interrupt vector register (FINTV) is provided to speed up response to interrupts.

The FINTV specifies a branch destination address when a fast interrupt has been generated.

(8) Floating-Point Status Word (FPSW)

The floating-point status word (FPSW) indicates the results of floating-point operations.

When an exception handling enable bit (Ej) enables the exception handling (Ej = 1), the corresponding Cj flag indicates the source of the exception within the exception handling routine. If the exception handling is masked (Ej = 0), check the Fj flag at the end of a series of processing whether an exception is generated or not. The Fj flag is the accumulation type flag (j = X, U, Z, O, or V).

(9) Accumulator (ACC)

The accumulator (ACC) is a 64-bit register used for DSP instructions. The accumulator is also used for the multiply and multiply-and-accumulate instructions; EMUL, EMULU, FMUL, MUL, and RMPA, in which case the prior value in the accumulator is modified by execution of the instruction.

Use the MVTACHI and MVTACLO instructions for writing to the accumulator. The MVTACHI and MVTACLO instructions write data to the higher-order 32 bits (bits 63 to 32) and the lower-order 32 bits (bits 31 to 0), respectively.

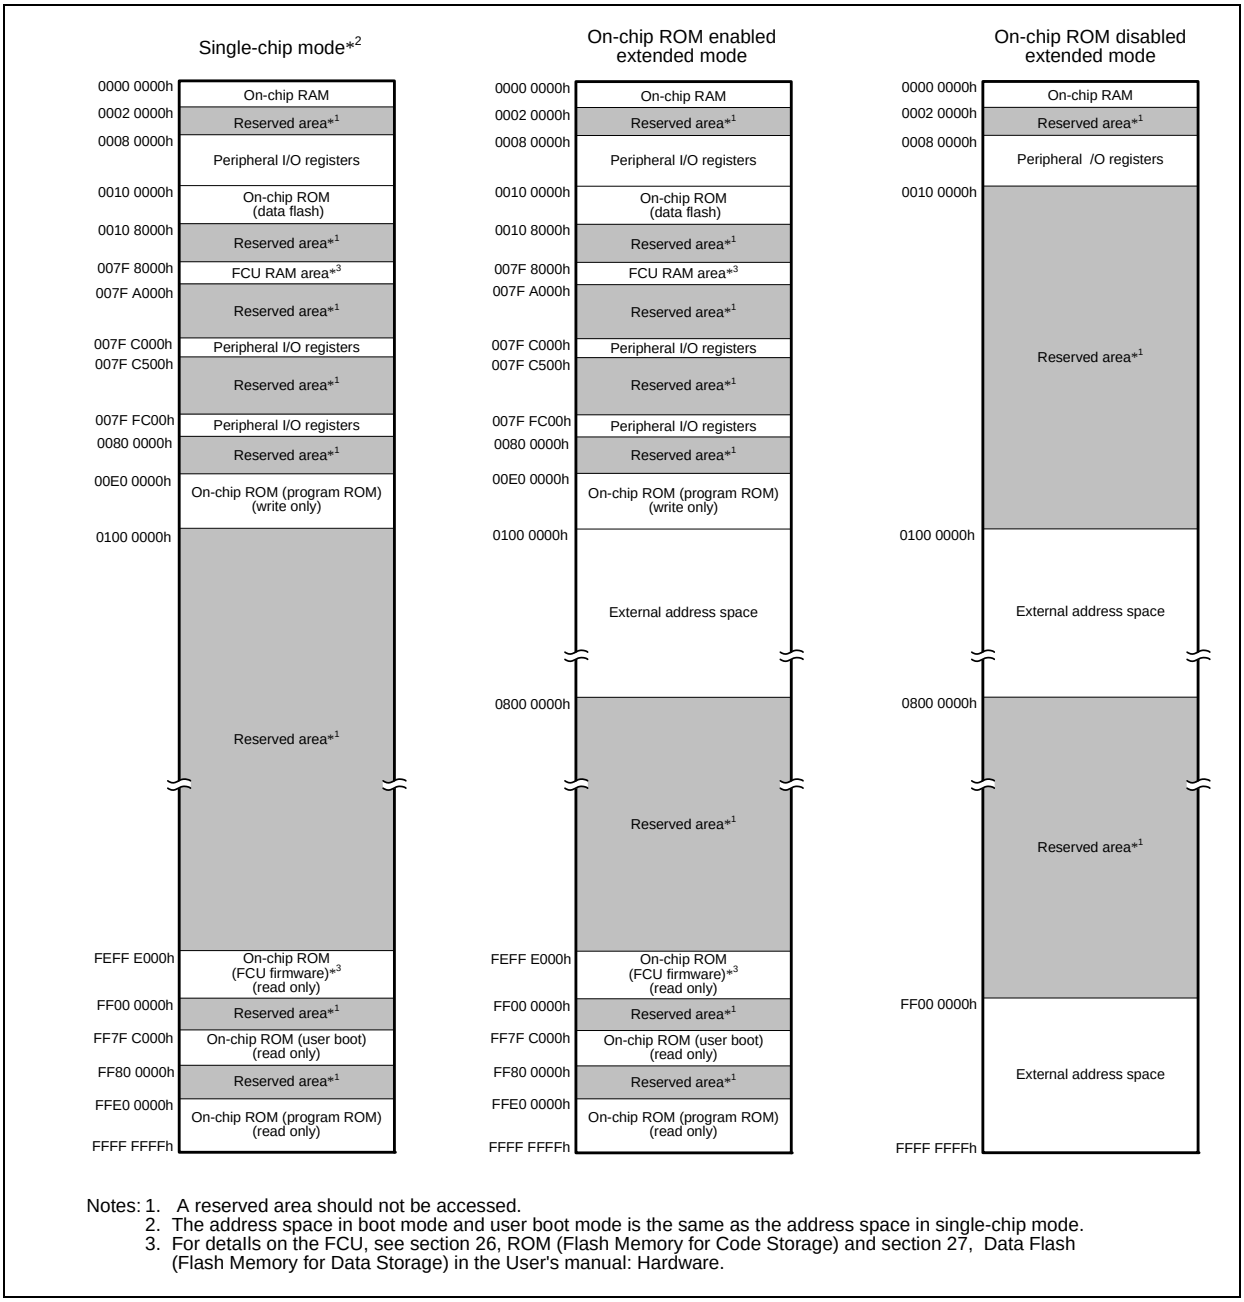
Use the MVFACHI and MVFACMI instructions for reading data from the accumulator. The MVFACHI and MVFACMI instructions read data from the higher-order 32 bits (bits 63 to 32) and the middle 32 bits (bits 47 to 16), respectively.

3. Address Space

3.1 Address Space

This MCU has a 4-Gbyte address space, consisting of the range of addresses from 0000 0000h to FFFF FFFFh. That is, linear access to an address space of up to 4 Gbytes is possible, and this contains both program and data areas.

Figures 4.1 to 4.4 show the memory maps in the respective operating modes of each product. Accessible areas will differ according to the operating mode and states of control bits.



Notes: 1. A reserved area should not be accessed.
2. The address space in boot mode and user boot mode is the same as the address space in single-chip mode.
3. For details on the FCU, see section 26, ROM (Flash Memory for Code Storage) and section 27, Data Flash (Flash Memory for Data Storage) in the User's manual: Hardware.

3.2 External Address Space

The external address space is divided into up to 8 areas, each corresponding to the CSi# signal output from a CSi# (i = 0 to 7) pin. Figure 4.5 shows the address ranges corresponding to the individual CSi# signals (CSi areas, i = 0 to 7) in on-chip ROM disabled external extended mode.

Notes:
1. When the same output trigger is specified for pulse output groups 2 and 3 by the PPG0.PCR setting, the PPG0.NDRH address is 000881ECh. When different output triggers are specified, the PPG0.NDRH addresses for pulse output groups 2 and 3 are 000881EEh and 000881ECh, respectively.
2. When the same output trigger is specified for pulse output groups 0 and 1 by the PPG0.PCR setting, the PPG0.NDRL address is 000881EDh. When different output triggers are specified, the PPG0.NDRL addresses for pulse output groups 0 and 1 are 000881EFh and 000881EDh, respectively.
3. When the same output trigger is specified for pulse output groups 6 and 7 by the PPG1.PCR setting, the PPG1.NDRH address is 000881FCh. When different output triggers are specified, the PPG1.NDRH addresses for pulse output groups 6 and 7 are 000881FEh and 000881FCh, respectively.
4. When the same output trigger is specified for pulse output groups 4 and 5 by the PPG1.PCR setting, the PPG1.NDRL address is 000881FDh. When different output triggers are specified, the PPG1.NDRL addresses for pulse output groups 4 and 5 are 000881FFh and 000881FDh, respectively.
5. 16-bit access to odd addresses is proh bited. When 16-bit access is required, access is at the address corresponding to TMR0 or TMR2.
6. For certain bits, functions differ according to whether the mode is serial communications or smart card interface.
7. The number of access cycles varies depending on the number of divided cycles for clock synchronization (0 to one PCLK).
8. The number of access cycles may be 5 ICLK if the register is accessed during the DMAC operation.

5.1 Absolute Maximum Ratings

Table 5.1 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}, $PLLV_{CC}$	-0.3 to +4.6	V
Input voltage (except for ports 0, 14 to 17)	V_{in}	-0.3 to V_{CC} +0.3	V
Input voltage (ports 0, 14 to 17*[1])	V_{in}	-0.3 to +6.5	V
Reference power supply voltage	V_{REFH}	-0.3 to V_{CC} +0.3	V
Analog power supply voltage	AV_{CC}*[2]	-0.3 to +4.6	V
Analog input voltage	V_{AN}	-0.3 to V_{CC} +0.3	V
Operating temperature	T_{opr}	Regular specifications: -20 to +85	C
		Wide-range specifications: -40 to +85	
Storage temperature	T_{stg}	-55 to +125	C

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Notes: 1. Ports 0, and 14 to 17 are 5 V tolerant.

2. Connect AV_{CC} to V_{CC}. When neither the A/D converter nor the D/A converter is in use, do not leave the AV_{SS}, V_{REFH}, and V_{REFL} pins open. Connect the AV_{CC} and V_{REFH} pins to V_{CC}, and the AV_{SS} and V_{REFL} pins to V_{SS}, respectively.

1. This does not include the pins, which are multiplexed as ports 0, and 14 to 17 for 5 V tolerant.
2. This includes the multiplexed pins, but RIIC input pins for ports 14 to 17 are excluded.
3. Supply current values are with all output pins unloaded, all input pins for $V_{IH} = V_{CC}$ and V_{IL}= 0 V, and all input pull-up resistors in the off state.
4. Measured with clocks supplied to the peripheral functions. This does not include the BGO operation.
5. I_{CC} depends on f (ICLK) as follows. (ICLK : PCLK : BCLK = 8 : 4: 2)

   I_{CC} max. = 0.89 x f + 11 (max.)
   I_{CC} typ. = 0.30 x f + 5 (normal operation)
   I_{CC} max. = 0.41 x f + 11 (sleep mode)
6. Measured with clocks not supplied to the peripheral functions. This does not include the BGO operation.
7. Incremented if data is written to or erased from the ROM or data flash for data storage during the program execution.
8. The values are for reference.
9. This can be applied when the RES# pin is held low at power-on.

Data hold time*3		T_{DRP}	10	—	—	Year	

Notes: 1. Definition of rewrite/erase cycle:
The rewrite/erase cycle is the number of erasing for each block. When the rewrite/erase cycle is n times (n = 1000), erasing can be performed n times for each block. For instance, when 256-byte writing is performed 32 times for different addresses in 8-Kbyte block and then the entire block is erased, the rewrite/erase cycle is counted as one. However, writing to the same address for several times as one erasing is not enabled (over writing is prohibited).
2. This indicates the minimum number that guarantees the characteristics after rewriting. (The guaranteed value is in the range from one to the minimum number.)
3. This indicates the characteristic when rewrite is performed within the specification range including the minimum number.

Notes: 1. Definition of rewrite/erase cycle:
The rewrite/erase cycle is the number of erasing for each block. When the rewrite/erase cycle is n times (n = 30000), erasing can be performed n times for each block. For instance, when 128-byte writing is performed 64 times for different addresses in 8-Kbyte block and then the entire block is erased, the rewrite/erase cycle is counted as one. However, writing to the same address for several times as one erasing is not enabled (over writing is prohibited).
2. This indicates the minimum number that guarantees the characteristics after rewriting. (The guaranteed value is in the range from one to the minimum number.)
3. This indicates the characteristic when rewrite is performed within the specification range including the minimum number.

General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

1. Handling of Unused Pins
   Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.
   — The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.
2. Processing at Power-on
   The state of the product is undefined at the moment when power is supplied.
   — The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
   In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.
   In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.
3. Prohibition of Access to Reserved Addresses
   Access to reserved addresses is prohibited.
   — The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.
4. Clock Signals
   After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.
   — When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.
5. Differences between Products
   Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.
   — The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
   - "Standard" Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic app iances; machine tools; personal electronic equipment; and industrial robots.
   - "High Quality" Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
   - "Specific" Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
