

Battery Management Unit Impedance Track™ Fuel Gauge for Use With the bq2416x Charger Controller

Check for Samples: [bq27530-G1](#)

FEATURES

- **Battery Fuel Gauge and Charger Controller for 1-Series Li-Ion Applications**
- **Resides on System Main Board**
- **Battery Fuel Gauge Based on Patented Impedance Track™ Technology**
 - Models the Battery Discharge Curve for Accurate Time-to-Empty Predictions
 - Automatically Adjusts for Battery Aging, Battery Self-Discharge, and Temperature/Rate Inefficiencies
 - Low-Value Sense Resistor (5 mΩ to 20 mΩ)
- **Battery Charger Controller with customizable charge profiles**
 - Configurable Charge Voltage and Current based on Temperature
 - Optional State of Health (SoH) and Multi-level based charge profiles
- **Host Free Autonomous Battery Management System**
 - Reduced software overhead allows for easy portability across platforms and shorter OEM design cycles
 - Higher safety and security
- **Run Time Improvements**
 - Longer battery runtime leveraging Impedance Track technology
 - Tighter accuracy controls for charger termination
 - Improved recharged thresholds
- **Intelligent Charging - Customized and adaptive charging profiles**
 - Charger Control based on SoH
 - Temperature Level Charging (TLC)
- **Battery Charger Controller for bq2416x Single Cell Switchmode Battery Charger**
 - Stand-Alone Charging Solution
- **400-kHz I²C™ Interface for Connection to System Microcontroller Port**
- **In a 15-Pin NanoFree™ (CSP) Packaging**

APPLICATIONS

- Smartphones, Feature phones and Tablets
- Digital Still and Video Cameras
- Handheld Terminals
- MP3 or Multimedia Players

DESCRIPTION

The Texas Instruments bq27530-G1 system-side Li-Ion Battery Management Unit is a microcontroller peripheral that provides Impedance Track™ fuel gauging and charging control for single-cell Li-Ion battery packs. The device requires little system microcontroller firmware development. Together with bq2416x Single Cell Switchmode Charger, the bq27530-G1 manages an embedded battery (non-removable) or a removable battery pack.

The bq27530-G1 uses the patented Impedance Track™ algorithm for fuel gauging, and provides information such as remaining battery capacity (mAh), state-of-charge (%), run-time to empty (min), battery voltage (mV), temperature (°C) and state of health (%).

Battery fuel gauging with the bq27530-G1 requires only PACK+ (P+), PACK– (P–), and Thermistor (T) connections to a removable battery pack or embedded battery circuit. The CSP option is a 15-ball package in the dimensions of 2,61 mm × 1,96 mm with 0,5 mm lead pitch. It is ideal for space constrained applications.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PIN ASSIGNMENT AND PACKAGE DIMENSIONS

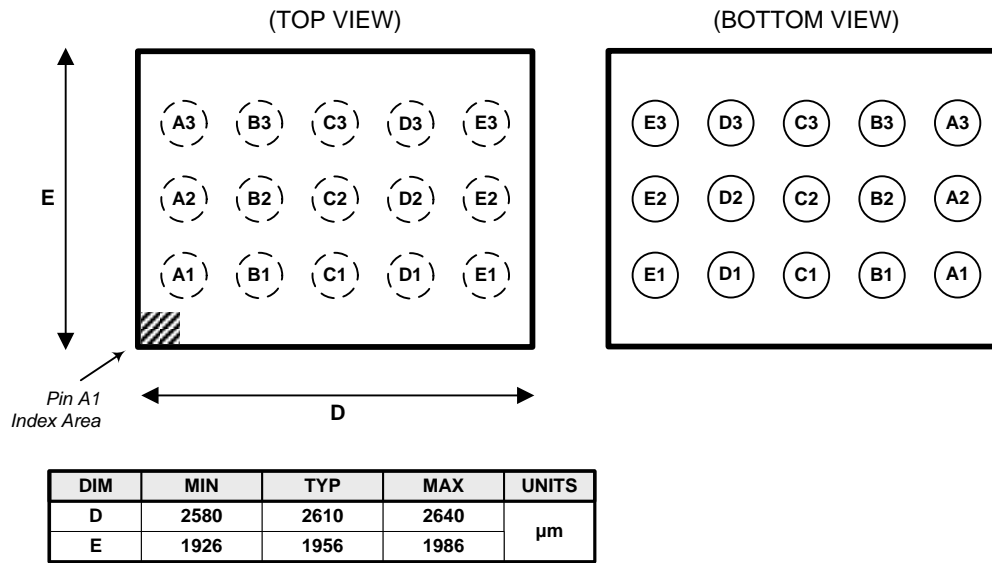

Table 1. PIN FUNCTIONS

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
SRP	A1	IA	Analog input pin connected to the internal coulomb counter where SRP is nearest the PACK– connection. Connect to 5-mΩ to 20-mΩ sense resistor.
SRN	B1	IA	Analog input pin connected to the internal coulomb counter where SRN is nearest the Vss connection. Connect to 5-mΩ to 20-mΩ sense resistor.
Vss	C1, C2	P	Device ground
Vcc	D1	P	Regulator output and bq27530-G1 power. Decouple with 1µF ceramic capacitor to Vss.
REGIN	E1	P	Regulator input. Decouple with 0.1µF ceramic capacitor to Vss.
SOC_INT	A2	I/O	SOC state interrupts output. Generates a pulse as described in <i>bq27530-G1 Technical Reference Manual</i> . Open drain output.
BSCCL	B2	O	Battery Charger clock output line for chipset communication. Push-pull output. Note: CE has an internal ESD protection diode connected to REGIN. Recommend maintaining $V_{CE} \leq V_{REGIN}$ under all conditions.
CE	D2	I	Chip Enable. Internal LDO is disconnected from REGIN when driven low.
BAT	E2	I	Cell-voltage measurement input. ADC input. Recommend 4.8V maximum for conversion accuracy.
SCL	A3	I	Slave I ² C serial communications clock input line for communication with system (Master). Open-drain I/O. Use with 10kΩ pull-up resistor (typical).
SDA	B3	I/O	Slave I ² C serial communications data line for communication with system (Master). Open-drain I/O. Use with 10kΩ pull-up resistor (typical).
BSDA	C3	I/O	Battery Charger data line for chipset communication. Push-pull output.
TS	D3	IA	Pack thermistor voltage sense (use 103AT-type thermistor). ADC input.
BI/TOUT	E3	I/O	Battery-insertion detection input. Power pin for pack thermistor network. Thermistor-multiplexer control pin. Use with pull-up resistor >1MΩ (1.8 MΩ typical).

(1) I/O = Digital input/output, IA = Analog input, P = Power connection

ELECTRICAL SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER		VALUE	UNIT
V _{REGIN}	Regulator input range	-0.3 to 5.5	V
		-0.3 to 6.0 ⁽²⁾	V
V _{CE}	CE input pin	-0.3 to V _{REGIN} + 0.3	V
V _{CC}	Supply voltage range	-0.3 to 2.75	V
V _{IOD}	Open-drain I/O pins (SDA, SCL, SOC_INT)	-0.3 to 5.5	V
V _{BAT}	BAT input pin	-0.3 to 5.5	V
		-0.3 to 6.0 ⁽²⁾	V
V _I	Input voltage range to all other pins (BI/TOUT, TS, SRP, SRN, BSDA, BSCL)	-0.3 to V _{CC} + 0.3	V
ESD	Human-body model (HBM), BAT pin	1.5	kV
	Human-body model (HBM), all other pins	2	
T _A	Operating free-air temperature range	-40 to 85	°C
T _{stg}	Storage temperature range	-65 to 150	°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Condition not to exceed 100 hours at 25 °C lifetime.

RECOMMENDED OPERATING CONDITIONS

T_A = -40°C to 85°C, V_{REGIN} = V_{BAT} = 3.6V (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{REGIN}	Supply voltage				V
	No operating restrictions	2.8		4.5	
	No FLASH writes	2.45		2.8	
C _{REGIN}	External input capacitor for internal LDO between REGIN and V _{SS}		0.1		μF
C _{LDO25}	External output capacitor for internal LDO between V _{CC} and V _{SS}	0.47	1		μF
t _{PUCD}	Power-up communication delay		250		ms

SUPPLY CURRENT

T_A = 25°C and V_{REGIN} = V_{BAT} = 3.6V (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{CC} ⁽¹⁾	Normal operating-mode current Fuel gauge in NORMAL mode. I _{LOAD} > Sleep Current		118		μA
I _{SLEEP+} ⁽¹⁾	Sleep+ operating mode current Fuel gauge in SLEEP+ mode. I _{LOAD} < Sleep Current		62		μA
I _{SLEEP} ⁽¹⁾	Low-power storage-mode current Fuel gauge in SLEEP mode. I _{LOAD} < Sleep Current		23		μA
I _{HIB} ⁽¹⁾	Hibernate operating-mode current Fuel gauge in HIBERNATE mode. I _{LOAD} < Hibernate Current		8		μA

- (1) Specified by design. Not production tested.

DIGITAL INPUT AND OUTPUT DC CHARACTERISTICS

 $T_A = -40^{\circ}\text{C}$ to 85°C , typical values at $T_A = 25^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OL}	Output voltage, low (SCL, SDA, SOC_INT, BSDA, BSCL)	$I_{\text{OL}} = 3\text{ mA}$			0.4	V
$V_{\text{OH(PP)}}$	Output voltage, high (BSDA, BSCL)	$I_{\text{OH}} = -1\text{ mA}$	$V_{\text{CC}} - 0.5$			V
$V_{\text{OH(OD)}}$	Output voltage, high (SDA, SCL, SOC_INT)	External pullup resistor connected to V_{CC}	$V_{\text{CC}} - 0.5$			
V_{IL}	Input voltage, low (SDA, SCL)		-0.3		0.6	V
	Input voltage, low (BI/TOUT)	BAT INSERT CHECK MODE active	-0.3		0.6	
V_{IH}	Input voltage, high (SDA, SCL)		1.2			V
	Input voltage, high (BI/TOUT)	BAT INSERT CHECK MODE active	1.2		$V_{\text{CC}} + 0.3$	
$V_{\text{IL(CE)}}$	Input voltage, low (CE)	$V_{\text{REGIN}} = 2.8$ to 4.5 V			0.8	V
$V_{\text{IH(CE)}}$	Input voltage, high (CE)				2.65	
$I_{\text{IKg}}^{(1)}$	Input leakage current (I/O pins)				0.3	μA

(1) Specified by design. Not production tested.

POWER-ON RESET

 $T_A = -40^{\circ}\text{C}$ to 85°C , typical values at $T_A = 25^{\circ}\text{C}$ and $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{\text{IT+}}$	Positive-going battery voltage input at V_{CC}	2.05	2.15	2.20	V
V_{HYS}	Power-on reset hysteresis	45	115	185	mV

2.5V LDO REGULATOR

 $T_A = -40^{\circ}\text{C}$ to 85°C , $C_{\text{LDO25}} = 1\mu\text{F}$, $V_{\text{REGIN}} = 3.6\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITION	MIN	NOM	MAX	UNIT
V_{REG25}	$2.8\text{ V} \leq V_{\text{REGIN}} \leq 4.5\text{ V}$, $I_{\text{OUT}} \leq 16\text{ mA}$	2.3	2.5	2.6	V
	$2.45\text{ V} \leq V_{\text{REGIN}} < 2.8\text{ V}$ (low battery), $I_{\text{OUT}} \leq 3\text{ mA}$	2.3			V

INTERNAL CLOCK OSCILLATORS

 $T_A = -40^{\circ}\text{C}$ to 85°C , $2.4\text{ V} < V_{\text{CC}} < 2.6\text{ V}$; typical values at $T_A = 25^{\circ}\text{C}$ and $V_{\text{CC}} = 2.5\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{OSC}	High Frequency Oscillator		2.097		MHz
f_{LOSC}	Low Frequency Oscillator		32.768		kHz

ADC (TEMPERATURE AND CELL MEASUREMENT) CHARACTERISTICS

$T_A = -40^{\circ}\text{C}$ to 85°C , $2.4\text{ V} < V_{CC} < 2.6\text{ V}$; typical values at $T_A = 25^{\circ}\text{C}$ and $V_{CC} = 2.5\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{ADC1}	Input voltage range (TS)	$V_{\text{SS}} - 0.125$		2	V
V_{ADC2}	Input voltage range (BAT)	$V_{\text{SS}} - 0.125$		5	V
$V_{\text{IN(ADC)}}$	Input voltage range	0.05		1	V
G_{TEMP}	Internal temperature sensor voltage gain		-2		mV/ $^{\circ}\text{C}$
$t_{\text{ADC_CONV}}$	Conversion time			125	ms
	Resolution	14		15	bits
$V_{\text{OS(ADC)}}$	Input offset		1		mV
$Z_{\text{ADC1}}^{(1)}$	Effective input resistance (TS)	8			M Ω
$Z_{\text{ADC2}}^{(1)}$	Effective input resistance (BAT)	bq27530-G1 not measuring cell voltage			M Ω
		bq27530-G1 measuring cell voltage		100	k Ω
$I_{\text{lkq(ADC)}}^{(1)}$	Input leakage current			0.3	μA

(1) Specified by design. Not tested in production.

INTEGRATING ADC (COULOMB COUNTER) CHARACTERISTICS

$T_A = -40^{\circ}\text{C}$ to 85°C , $2.4\text{ V} < V_{CC} < 2.6\text{ V}$; typical values at $T_A = 25^{\circ}\text{C}$ and $V_{CC} = 2.5\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
V_{SR}	Input voltage range, $V_{\text{(SRP)}}$ and $V_{\text{(SRN)}}$	$V_{\text{SR}} = V_{\text{(SRP)}} - V_{\text{(SRN)}}$		-0.125	0.125	V
$t_{\text{SR_CONV}}$	Conversion time	Single conversion				
	Resolution	14	1	15	s	
$V_{\text{OS(SR)}}$	Input offset		10		μV	
INL	Integral nonlinearity error		± 0.007	± 0.034	% FSR	
$Z_{\text{IN(SR)}}^{(1)}$	Effective input resistance	2.5			M Ω	
$I_{\text{lkq(SR)}}^{(1)}$	Input leakage current			0.3	μA	

(1) Specified by design. Not tested in production.

DATA FLASH MEMORY CHARACTERISTICS

$T_A = -40^{\circ}\text{C}$ to 85°C , $2.4\text{ V} < V_{CC} < 2.6\text{ V}$; typical values at $T_A = 25^{\circ}\text{C}$ and $V_{CC} = 2.5\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{DR}^{(1)}$	Data retention	10			Years
	Flash-programming write cycles ⁽¹⁾	20,000			Cycles
$t_{WORDPROG}^{(1)}$	Word programming time			2	ms
$I_{CCPROG}^{(1)}$	Flash-write supply current		5	10	mA
$t_{DFERASE}^{(1)}$	Data flash master erase time	200			ms
$t_{IFERASE}^{(1)}$	Instruction flash master erase time	200			ms
$t_{PGERASE}^{(1)}$	Flash page erase time	20			ms

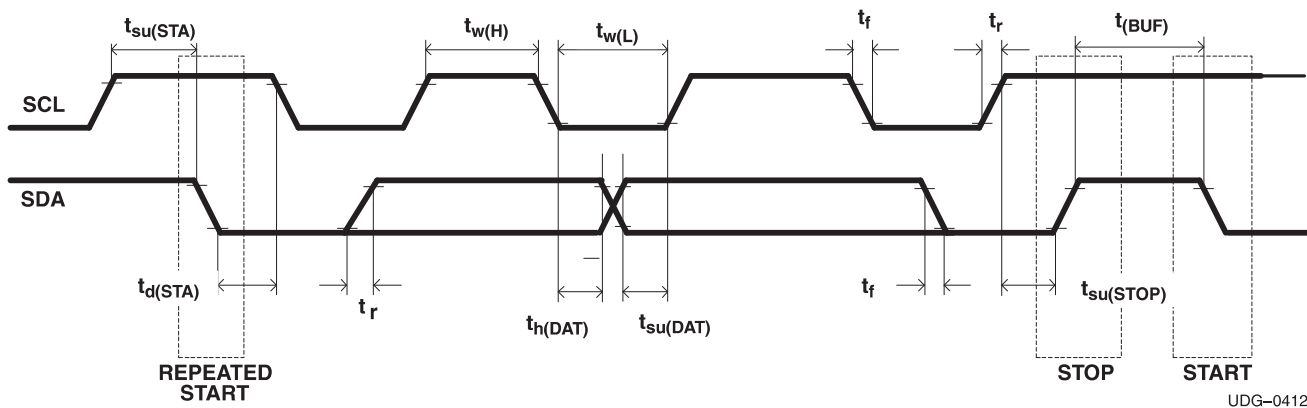

(1) Specified by design. Not production tested

I²C-COMPATIBLE INTERFACE COMMUNICATION TIMING CHARACTERISTICS

$T_A = -40^{\circ}\text{C}$ to 85°C , $2.4\text{ V} < V_{CC} < 2.6\text{ V}$; typical values at $T_A = 25^{\circ}\text{C}$ and $V_{CC} = 2.5\text{ V}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_r	SCL/SDA rise time			300	ns
t_f	SCL/SDA fall time			300	ns
$t_{w(H)}$	SCL pulse duration (high)	600			ns
$t_{w(L)}$	SCL pulse duration (low)	1.3			μs
$t_{su(STA)}$	Setup for repeated start	600			ns
$t_{d(STA)}$	Start to first falling edge of SCL	600			ns
$t_{su(DAT)}$	Data setup time	100			ns
$t_{h(DAT)}$	Data hold time	0			ns
$t_{su(STOP)}$	Setup time for stop	600			ns
$t_{(BUF)}$	Bus free time between stop and start	66			μs
f_{SCL}	Clock frequency ⁽¹⁾			400	kHz

(1) If the clock frequency (f_{SCL}) is $> 100\text{ kHz}$, use 1-byte write commands for proper operation. All other transactions types are supported at 400 kHz. (Refer to [I²C INTERFACE](#) and [I²C Command Waiting Time](#))

Figure 1. I²C-Compatible Interface Timing Diagrams

GENERAL DESCRIPTION

The bq27530-G1 accurately predicts the battery capacity and other operational characteristics of a single Li-based rechargeable cell. It can be interrogated by a system processor to provide cell information, such as time-to-empty (TTE), and state-of-charge (SOC) as well as SOC interrupt signal to the host.

The bq27530-G1 can control a bq2416x Charger IC without the intervention from an application system processor. Using the bq27530-G1 and bq2416x chipset, batteries can be charged with the typical constant-current, constant voltage (CCCV) profile or charged using a Multi-Level Charging (MLC) algorithm.

Information is accessed through a series of commands, called *Standard Commands*. Further capabilities are provided by the additional *Extended Commands* set. Both sets of commands, indicated by the general format *Command()*, are used to read and write information contained within the device control and status registers, as well as its data flash locations. Commands are sent from system to gauge using the bq27530-G1's I²C serial communications engine, and can be executed during application development, pack manufacture, or end-equipment operation.

Cell information is stored in the device in non-volatile flash memory. Many of these data flash locations are accessible during application development. They cannot, generally, be accessed directly during end-equipment operation. Access to these locations is achieved by either use of the bq27530-G1's companion evaluation software, through individual commands, or through a sequence of data-flash-access commands. To access a desired data flash location, the correct data flash subclass and offset must be known.

The key to the bq27530-G1 high-accuracy gas gauging prediction is Texas Instrument's proprietary Impedance Track™ algorithm. This algorithm uses cell measurements, characteristics, and properties to create state-of-charge predictions that can achieve less than 1% error across a wide variety of operating conditions and over the lifetime of the battery.

The device measures battery charge/discharge activity by monitoring the voltage across a small-value series sense resistor (5 mΩ to 20 mΩ typ.) located between the system's V_{SS} and the battery's PACK- terminal. When a cell is attached to the device, cell impedance is computed, based on cell current, cell open-circuit voltage (OCV), and cell voltage under loading conditions.

The device external temperature sensing is optimized with the use of a high accuracy negative temperature coefficient (NTC) thermistor with R₂₅ = 10.0kΩ ±1%, B_{25/85} = 3435K ± 1% (such as Semitec NTC 103AT). The bq27530-G1 can also be configured to use its internal temperature sensor. When an external thermistor is used, a 18.2k pull up resistor between BI/TOUT and TS pins is also required. The bq27530-G1 uses temperature to monitor the battery-pack environment, which is used for fuel gauging and cell protection functionality.

To minimize power consumption, the device has different power modes: NORMAL, SLEEP, SLEEP+, HIBERNATE, and BAT INSERT CHECK. The bq27530-G1 passes automatically between these modes, depending upon the occurrence of specific events, though a system processor can initiate some of these modes directly.

For complete operational details, refer to [bq27530-G1 Technical Reference Manual](#).

NOTE

FORMATTING CONVENTIONS IN THIS DOCUMENT:

Commands: *italics* with parentheses and no breaking spaces, e.g., *RemainingCapacity()*

Data flash: *italics*, **bold**, and *breaking spaces*, e.g., **Design Capacity**

Register bits and flags: brackets and *italics*, e.g., [TDA]

Data flash bits: brackets, *italics* and **bold**, e.g., [LED1]

Modes and states: ALL CAPITALS, e.g., UNSEALED mode.

DATA COMMANDS

STANDARD DATA COMMANDS

The bq27530-G1 uses a series of 2-byte standard commands to enable system reading and writing of battery information. Each standard command has an associated command-code pair, as indicated in [Table 2](#). Because each command consists of two bytes of data, two consecutive I²C transmissions must be executed both to initiate the command function, and to read or write the corresponding two bytes of data. Additional details are found in the [bq27530-G1 Technical Reference Manual](#).

Table 2. Standard Commands

NAME	COMMAND CODE	UNITS	SEALED ACCESS	UNSEALED ACCESS
<i>Control()</i>	0x00 / 0x01	N/A	R/W	R/W
<i>AtRate()</i>	0x02 / 0x03	mA	R/W	R/W
<i>AtRateTimeToEmpty()</i>	0x04 / 0x05	Minutes	R	R/W
<i>Temperature()</i>	0x06 / 0x07	0.1 K	R/W	R/W
<i>Voltage()</i>	0x08 / 0x09	mV	R	R/W
<i>Flags()</i>	0x0a / 0x0b	N/A	R	R/W
<i>NominalAvailableCapacity()</i>	0x0c / 0x0d	mAh	R	R/W
<i>FullAvailableCapacity()</i>	0x0e / 0x0f	mAh	R	R/W
<i>RemainingCapacity()</i>	0x10 / 0x11	mAh	R	R/W
<i>FullChargeCapacity()</i>	0x12 / 0x13	mAh	R	R/W

<i>CalcChargingVoltage()</i>	0x72 / 0x73	V	R	R

(1) Only writeable when **Charger Options [BYPASS]** is set.

Control(): 0x00/0x01

Issuing a *Control()* command requires a subsequent 2-byte subcommand. These additional bytes specify the particular control function desired. The *Control()* command allows the system to control specific features of the bq27530-G1 during normal operation and additional features when the device is in different access modes, as described in [Table 3](#). Additional details are found in the [bq27530-G1 Technical Reference Manual](#).

Table 3. Control() Subcommands

CNTL FUNCTION	CNTL DATA	SEALED ACCESS	DESCRIPTION
CONTROL_STATUS	0x0000	Yes	Reports the status of hibernate, IT, etc.
DEVICE_TYPE	0x0001	Yes	Reports the device type (eg: bq27530)
FW_VERSION	0x0002	Yes	Reports the firmware version on the device type
HW_VERSION	0x0003	Yes	Reports the hardware version of the device type
PREV_MACWRITE	0x0007	Yes	Returns previous MAC subcommand code
CHEM_ID	0x0008	Yes	Reports the chemical identifier of the Impedance Track™ configuration
BOARD_OFFSET	0x0009	No	Forces the device to measure and store the board offset
CC_OFFSET	0x000a	No	Forces the device to measure the internal CC offset
CC_OFFSET_SAVE	0x000b	No	Forces the device to store the internal CC offset
OCV_CMD	0x000c	Yes	Request the gauge to take a OCV measurement
BAT_INSERT	0x000d	Yes	Forces the BAT_DET bit set when the [BIE] bit is 0
BAT_REMOVE	0x000e	Yes	Forces the BAT_DET bit clear when the [BIE] bit is 0
SET_HIBERNATE	0x0011	Yes	Forces CONTROL_STATUS [HIBERNATE] to 1
CLEAR_HIBERNATE	0x0012	Yes	Forces CONTROL_STATUS [HIBERNATE] to 0
SET_SLEEP+	0x0013	Yes	Forces CONTROL_STATUS [SNOOZE] to 1
CLEAR_SLEEP+	0x0014	Yes	Forces CONTROL_STATUS [SNOOZE] to 0
DIV_CUR_ENABLE	0x0017	Yes	Makes the programmed charge current to be half of what is calculated by the gauge charging algorithm.
CHG_ENABLE	0x001A	Yes	Enable charger. Charge will continue as dictated by gauge charging algorithm.
CHG_DISABLE	0x001B	Yes	Disable charger (Set \overline{CE} bit of bq2416x)
GG_CHGRCTL_ENABLE	0x001C	Yes	Enables the gas gauge to control the charger while continuously resetting the charger watchdog
GG_CHGRCTL_DISABLE	0x001D	Yes	The gas gauge stops resetting the charger watchdog
DIV_CUR_DISABLE	0x001E	Yes	Makes the programmed charge current to be same as what is calculated by the gauge charging algorithm.
DF_VERSION	0x001F	Yes	Returns the Data Flash Version
SEALED	0x0020	No	Places device in SEALED access mode
IT_ENABLE	0x0021	No	Enables the Impedance Track™ algorithm
RESET	0x0041	No	Forces a full reset of the bq27530-G1

FUNCTIONAL DESCRIPTION

The bq27530-G1 measures the cell voltage, temperature, and current to determine battery SOC. The bq27530-G1 monitors charge and discharge activity by sensing the voltage across a small-value resistor (5 mΩ to 20 mΩ typ.) between the SRP and SRN pins and in series with the cell. By integrating charge passing through the battery, the battery's SOC is adjusted during battery charge or discharge.

The total battery capacity is found by comparing states of charge before and after applying the load with the amount of charge passed. When an application load is applied, the impedance of the cell is measured by comparing the OCV obtained from a predefined function for present SOC with the measured voltage under load. Measurements of OCV and charge integration determine chemical state of charge and chemical capacity (Qmax). The initial Qmax values are taken from a cell manufacturers' data sheet multiplied by the number of parallel cells. It is also used for the value in **Design Capacity**. The bq27530-G1 acquires and updates the battery-impedance profile during normal battery usage. It uses this profile, along with SOC and the Qmax value, to determine *FullChargeCapacity*() and *StateOfCharge*(), specifically for the present load and temperature. *FullChargeCapacity*() is reported as capacity available from a fully charged battery under the present load and temperature until *Voltage*() reaches the **Terminate Voltage**. *NominalAvailableCapacity*() and *FullAvailableCapacity*() are the uncompensated (no or light load) versions of *RemainingCapacity*() and *FullChargeCapacity*() respectively.

The bq27530-G1 has two flags accessed by the *Flags*() function that warns when the battery's SOC has fallen to critical levels. When *RemainingCapacity*() falls below the first capacity threshold, specified in **SOC1 Set Threshold**, the [SOC1] (*State of Charge Initial*) flag is set. The flag is cleared once *RemainingCapacity*() rises above **SOC1 Clear Threshold**.

When *Voltage*() falls below the system shut down threshold voltage, **SysDown Set Volt Threshold**, the [SYSDOWN] flag is set, serving as a final warning to shut down the system. The SOC_INT also signals. When *Voltage*() rises above **SysDown Clear Voltage** and the [SYSDOWN] flag has already been set, the [SYSDOWN] flag is cleared. The SOC_INT also signals such change. All units are in mV.

When the voltage is discharged to **Terminate Voltage**, the SOC will be set as 0.

COMMUNICATIONS

I²C INTERFACE

The bq27530-G1 supports the standard I²C read, incremental read, quick read, one byte write, and incremental write functions. The 7 bit device address (ADDR) is the most significant 7 bits of the hex address and is fixed as 1010101. The first 8-bits of the I²C protocol will; therefore, be 0xAA or 0xAB for write or read, respectively.

Host generated Gauge generated

(a) 1-byte write

(b) quick read

(c) 1- byte read

(d) incremental read

(e) incremental write

(S = Start, Sr = Repeated Start, A = Acknowledge, N = No Acknowledge, and P = Stop).

The “quick read” returns data at the address indicated by the address pointer. The address pointer, a register internal to the I²C communication engine, will increment whenever data is acknowledged by the bq27530-G1 or the I²C master. “Quick writes” function in the same manner and are a convenient means of sending multiple bytes to consecutive command locations (such as two-byte commands that require two bytes of data)

The following command sequences are not supported:

Attempt to write a read-only address (NACK after data sent by master):

Attempt to read an address above 0x6B (NACK command):

I²C Time Out

The I²C engine will release both SDA and SCL if the I²C bus is held low for 2 seconds. If the bq27530-G1 was holding the lines, releasing them will free them for the master to drive the lines. If an external condition is holding either of the lines low, the I²C engine will enter the low power sleep mode.

I²C Command Waiting Time

To ensure proper operation at 400 kHz, a $t_{(BUF)} \geq 66 \mu s$ bus free waiting time should be inserted between all packets addressed to the bq27530-G1. In addition, if the SCL clock frequency (f_{SCL}) is > 100 kHz, use individual 1-byte write commands for proper data flow control. The following diagram shows the standard waiting time required between issuing the control subcommand the reading the status result. A DF_CHECKSUM subcommand requires 100mS minimum prior to reading the result. An OCV_CMD subcommand requires 1.2 seconds prior to reading the result. For read-write standard command, a minimum of 2 seconds is required to get the result updated. For read-only standard commands, there is no waiting time required, but the host should not issue all standard commands more than two times per second. Otherwise, the gauge could result in a reset issue due to the expiration of the watchdog timer.

Waiting time inserted between two 1-byte write packets for a subcommand and reading results
(required for $100 \text{ kHz} < f_{SCL} \leq 400 \text{ kHz}$)

Waiting time inserted between incremental 2-byte write packet for a subcommand and reading results
(acceptable for $f_{SCL} \leq 100 \text{ kHz}$)

Waiting time inserted after incremental read

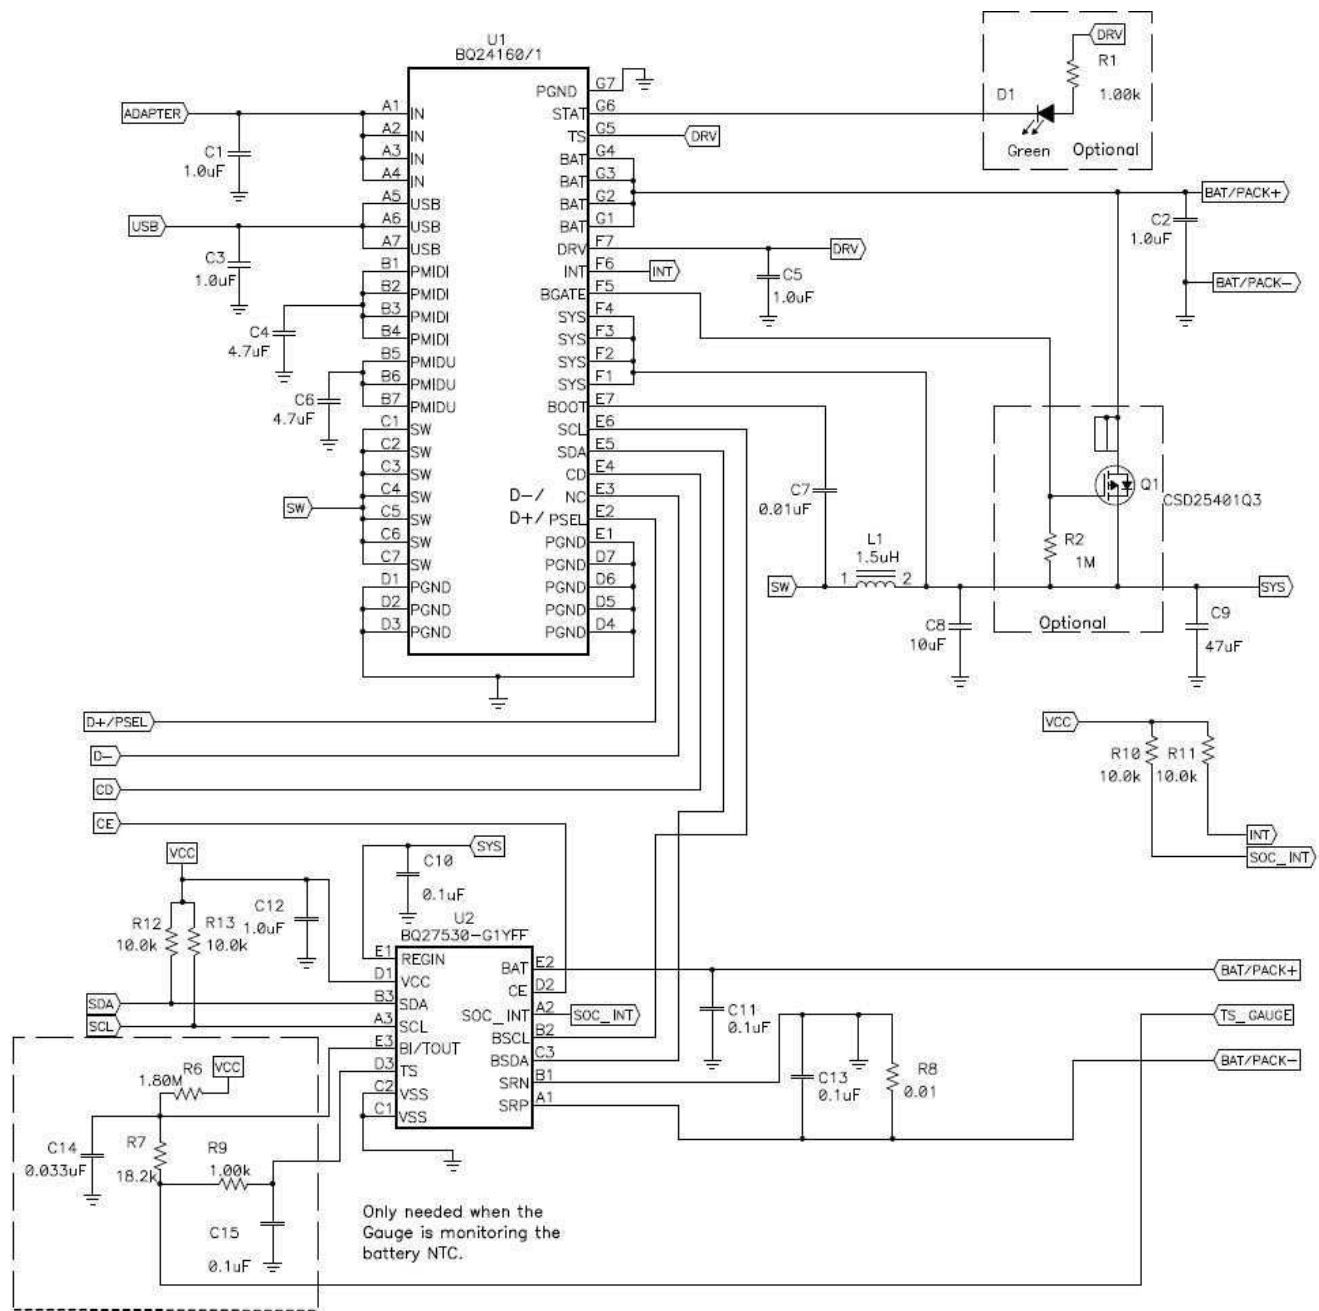

I²C Clock Stretching

A clock stretch can occur during all modes of fuel gauge operation. In SLEEP and HIBERNATE modes, a short clock stretch will occur on all I²C traffic as the device must wake-up to process the packet. In the other modes (BAT INSERT CHECK, NORMAL, SLEEP+) clock stretching will only occur for packets addressed for the fuel gauge. The majority of clock stretch periods are small as the I²C interface performs normal data flow control. However, less frequent yet more significant clock stretch periods may occur as blocks of Data Flash are updated. The following table summarizes the approximate clock stretch duration for various fuel gauge operating conditions.

Gauging Mode	Operating Condition / Comment	Approximate Duration
SLEEP HIBERNATE	Clock stretch occurs at the beginning of all traffic as the device wakes up.	$\leq 4 \text{ ms}$
BAT INSERT CHECK NORMAL SLEEP+	Clock stretch occurs within the packet for flow control. (after a start bit, ACK or first data bit)	$\leq 4 \text{ ms}$
	Normal Ra table Data Flash updates.	24 ms
	Data Flash block writes.	72 ms
	Restored Data Flash block write after loss of power.	116 ms
	End of discharge Ra table Data Flash update.	144 ms

SCHEMATIC

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
BQ27530YZFR-G1	ACTIVE	DSBGA	YZF	15	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ27530	Samples
BQ27530YZFT-G1	ACTIVE	DSBGA	YZF	15	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ27530	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DIE-SIZE BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. NanoFree™ package configuration.
 - \triangle The package size (Dimension D and E) of a particular device is specified in the device Product Data Sheet version of this drawing, in case it cannot be found in the product data sheet please contact a local TI representative.
 - \triangle Reference Product Data Sheet for array population.
3 x 5 matrix pattern is shown for illustration only.
 - F. This package contains Pb-free balls.

NanoFree is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
