# 120-V Boot, 4-A Peak, High Frequency High-Side and Low-Side Driver

Check for Samples: UCC27210, UCC27211

## **FEATURES**

- **Drives Two N-Channel MOSFETs in High-Side** and Low-Side Configuration with Independent Inputs
- Maximum Boot Voltage 120-V DC
- 4-A Sink, 4-A Source Output Currents •
- 0.9-Ω Pull-Up and Pull-Down Resistance
- Input Pins can Tolerate -10 V to 20 V and are ٠ Independent of Supply Voltage Range
- **TTL or Pseudo-CMOS Compatible Input** Versions
- 8-V to 17-V VDD Operating Range, (20-V ABS MAX)
- 7.2-ns Rise and 5.5-ns Fall Time with 1000-pF ٠ Load
- Fast Propagation Delay Times (18 ns typical) ٠
- 2-ns Delay Matching
- Symmetrical Under Voltage Lockout for High-Side and Low-Side Driver
- All Industry Standard Packages Available ٠ (SOIC-8, PowerPAD<sup>™</sup> SOIC-8, 4-mm x 4-mm SON-8 and 4-mm x 4-mm SON-10)
- Specified from -40 to 140 °C

## **APPLICATIONS**

- Power Supplies for Telecom, Datacom, and • Merchant
- Half-Bridge and Full-Bridge Converters
- **Push-Pull Converters**
- High Voltage Synchronous-Buck Converters ٠
- **Two-Switch Forward Converters**
- **Active-Clamp Forward Converters**
- **Class-D Audio Amplifiers**

## DESCRIPTION

The UCC27210 and UCC27211 Drivers are based on the popular UCC27200 and UCC27201 MOSFET drivers, but offer several significant performance improvements. Peak output pull-up and pull-down current has been increased to 4-A source and 4-A sink, and pull-up and pull-down resistance have been reduced to 0.9 Ω, thereby allowing for driving large power MOSFETs with minimized switching losses during the transition through the MOSFET's Miller Plateau. The input structure is now able to directly handle -10 VDC, which increases robustness and also allows direct interface to gate-drive transformers without using rectification diodes. The inputs are also independent of supply voltage and have a 20-V maximum rating.

53

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. PowerPAD is a trademark of Texas Instruments.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

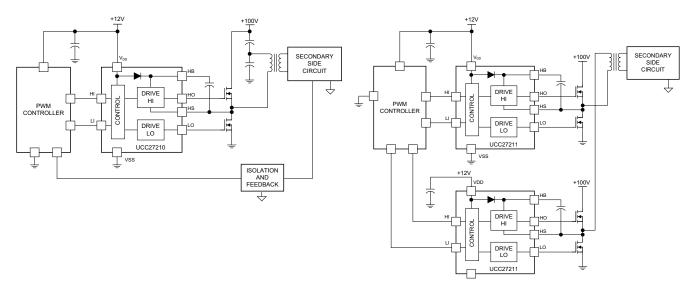

## **DESCRIPTION (CONT.)**

The UCC27210/1's switching node (HS pin) is able to handle -18 V maximum which allows the high-side channel to be protected from inherent negative voltages caused parasitic inductance and stray capacitance. The UCC27210 (Pseudo-CMOS inputs) and UCC27211 (TTL inputs) have increased hysteresis allowing for interface to analog or digital PWM controllers with enhanced noise immunity.

The low-side and high-side gate drivers are independently controlled and matched to 2 ns between the turn on and turn off of each other.

An on-chip 120-V rated bootstrap diode eliminates the external discrete diodes. Under-voltage lockout is provided for both the high-side and the low-side drivers providing symmetric turn-on/turn-off behavior and forcing the outputs low if the drive voltage is below the specified threshold.

Both devices are offered in 8-pin SOIC (D), PowerPAD<sup>™</sup> SOIC-8 (DDA), 4-mm x 4-mm SON-8 (DRM) and SON-10 (DPR) packages.

## **Typical Application Diagrams**

#### ORDERING INFORMATION <sup>(1)</sup>

	INPUT		PACKAGED	DEVICES <sup>(1)</sup>	
TEMPERATURE RANGE T <sub>A</sub> = T <sub>J</sub>	COMPATIBILITY	SOIC-8 (D) <sup>(2)</sup>	PowerPAD™ SOIC-8 (DDA) <sup>(2)</sup>	SON-8 (DRM) <sup>(3)</sup>	SON-10 (DPR) <sup>(4)</sup>
1000 10 11000	Pseudo CMOS	UCC27210D	UCC27210DDA	UCC27210DRM	UCC27210DPR
-40°C to 140°C	TTL	UCC27211D	UCC27211DDA	UCC27211DRM	UCC27211DPR

(1) These products are packaged in Lead (Pb)-Free and green lead finish of PdNiAu which is compatible with MSL level 1 at 255°C to 260°C peak reflow temperature to be compatible with either lead free or Sn/Pb soldering operations.

(2) D (SOIC-8) and DDA (Power Pad<sup>™</sup> SOIC-8) packages are available taped and reeled. Add R suffix to device type (e.g.

UCC27210ADR/UCC27211ADR) to order quantities of 2,500 devices per reel.

(3) DRM (SON-8) package comes either in a small reel of 250 pieces as part number UCC27210ADRMT/UCC27211ADRMT, or larger reels of 3000 pieces as part number UCC27210ADRMR/UCC27211ADRMR.

(4) DPR (SON-10) package comes either in a small reel of 250 pieces as part number UCC27210ADPRT/UCC27211ADPRT, or large reels of 3000 pieces as part number UCC27210ADPRR/UCC27211ADPRR.

For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.
 The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as

specified in JESD51-7, in an environment described in JESD51-2a.

(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDECstandard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

(5) The junction-to-top characterization parameter,  $\psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).

(6) The junction-to-board characterization parameter,  $\psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).

(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

TERMINAL	FUNCTIONS
----------	-----------

PIN NAME	PIN	J	DESCRIPTION
	D/DDA/DRM	DPR	DESCRIPTION
VDD	1	1	Positive supply to the lower-gate driver. De-couple this pin to V <sub>SS</sub> (GND). Typical decoupling capacitor range is 0.22 $\mu$ F to 4.7 $\mu$ F (See <sup>(1)</sup> ).
НВ	2	2	High-side bootstrap supply. The bootstrap diode is on-chip but the external bootstrap capacitor is required. Connect positive side of the bootstrap capacitor to this pin. Typical range of HB bypass capacitor is 0.022 $\mu F$ to 0.1 $\mu F$ . The capacitor value is dependant on the gate charge of the high-side MOSFET and should also be selected based on speed and ripple criteria
НО	3	3	High-side output. Connect to the gate of the high-side power MOSFET.
HS	4	4	High-side source connection. Connect to source of high-side power MOSFET. Connect the negative side of bootstrap capacitor to this pin.
HI	5	7	High-side input.
LI	6	8	Low-side input.
VSS	7	9	Negative supply terminal for the device which is generally grounded.
LO	8	10	Low-side output. Connect to the gate of the low-side power MOSFET.
N/C	-	5/6	Not Connected.
PowerPAD <sup>™ (2)</sup>	Pad	Pad	Utilized on the DDA, DRM and DPR packages only. Electrically referenced to $V_{SS}$ (GND). Connect to a large thermal mass trace or GND plane to dramatically improve thermal performance.

For cold temperature applications we recommend the upper capacitance range. Attention should also be made to PCB layout - see (1)

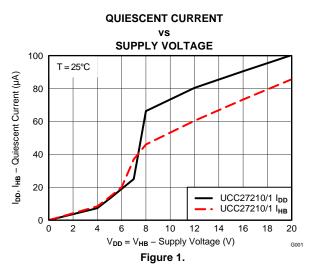

Layout Recommendations. The PowerPAD<sup>™</sup> is not directly connected to any leads of the package. However it is electrically and thermally connected to the substrate which is the ground of the device. (2)

## **APPLICATION INFORMATION**

### **Functional Description**

The UCC27210/11 represent Texas Instruments' latest generation of high voltage gate drivers which are designed to drive both the high-side and low-side of N-Channel MOSFETs in a half-/full-bridge or synchronous buck configuration. The floating high-side driver is capable of operating with supply voltages of up to 120 V. This allows for N-Channel MOSFET control in half-bridge, full-bridge, push pull, two-switch forward and active clamp forward converters.

The UCC27210/11 feature 4-A source/sink capability, industry best-in-class switching characteristics and a host of other features listed in the table below. These features combine to ensure efficient, robust and reliable operation in high-frequency switching power circuits.

FEATURE	BENEFIT
4-A source and sink current with $0.9-\Omega$ output resistance	High peak current ideal for driving large power MOSFETs with minimal power loss (fast-drive capability at Miller plateau)
Input pins (HI and LI) can directly handle -10 VDC up to 20 VDC	Increased robustness and ability to handle under/overshoot. Can interface directly to gate-drive transformers without having to use rectification diodes
120-V internal boot diode	Provides voltage margin to meet telecom 100-V surge requirements
Switch node (HS pin) able to handle -18 V maximum for 100 ns	Allows the high-side channel to have extra protection from inherent negative voltages caused parasitic inductance and stray capacitance.
Robust ESD circuitry to handle voltage spikes	Excellent immunity to large dV/dT conditions
18-ns propagation delay with 7.2-ns / 5.5-ns rise/fall Times	Best-in-class switching characteristics and extremely low-pulse transmission distortion
2-ns (typ) delay matching between channels	Avoids transformer volt-second offset in bridge
Symmetrical UVLO circuit	Ensures high-side and low-side shut down at the same time
CMOS optimized threshold or TTL optimized thresholds with increased hysteresis	Complementary to analog or digital PWM controllers. Increased hysteresis offers added noise immunity

#### Table 1. UCC27210/11 Highlights

In UCC27210/11, the high side and low side each have independent inputs which allow maximum flexibility of input control signals in the application. The boot diode for the high-side driver bias supply is internal to the UCC27210 and UCC27211. The UCC27210 is the Pseudo-CMOS compatible input version and the UCC27211 is the TTL or logic compatible version. The high-side driver is referenced to the switch node (HS) which is typically the source pin of the high-side MOSFET and drain pin of the low-side MOSFET. The low-side driver is referenced to  $V_{SS}$  which is typically ground. The functions contained are the input stages, UVLO protection, level shift, boot diode, and output driver stages.

Copyright © 2011-2012, Texas Instruments Incorporated

#### www.ti.com

### **Input Stages**

The input stages provide the interface to the PWM output signals. The input impedance of the UCC27210 is 100 k $\Omega$  nominal and input capacitance is approximately 2 pF. The 100 k $\Omega$  is a pull-down resistance to V<sub>SS</sub> (ground). The UCC27210 Pseudo-CMOS input structure has been designed to provide large hysteresis and at the same time to allows interfacing to a multitude of analog or digital PWM controllers. In some CMOS designs, the input thresholds are determined as a percentage of VDD. By doing so, the high-level input threshold can become unreasonably high and unusable. The UCC27210 recognizes the fact that VDD levels are trending downward and it therefore provides a rising threshold with 5.0 V (typ) and falling threshold with 3.2 V (typ). The input hysteresis of the UCC27210 is 1.8 V (typ).

The input stages of the UCC27211 have impedance of 70 k $\Omega$  nominal and input capacitance is approximately 2 pF. Pull-down resistance to V<sub>SS</sub> (ground) is 70 k $\Omega$ . The logic level compatible input provides a rising threshold of 2.3 V and a falling threshold of 1.6 V.

### Under Voltage Lockout (UVLO)

The bias supplies for the high-side and low-side drivers have UVLO protection.  $V_{DD}$  as well as  $V_{HB}$  to  $V_{HS}$  differential voltages are monitored. The  $V_{DD}$  UVLO disables both drivers when  $V_{DD}$  is below the specified threshold. The rising  $V_{DD}$  threshold is 7.0 V with 0.5-V hysteresis. The VHB UVLO disables only the high-side driver when the  $V_{HB}$  to  $V_{HS}$  differential voltage is below the specified threshold. The  $V_{HB}$  UVLO rising threshold is 6.7 V with 1.1-V hysteresis.

#### Level Shift

The level shift circuit is the interface from the high-side input to the high-side driver stage which is referenced to the switch node (HS). The level shift allows control of the HO output referenced to the HS pin and provides excellent delay matching with the low-side driver.

### **Boot Diode**

The boot diode necessary to generate the high-side bias is included in the UCC27210/11 family of drivers. The diode anode is connected to  $V_{DD}$  and cathode connected to  $V_{HB}$ . With the  $V_{HB}$  capacitor connected to HB and the HS pins, the  $V_{HB}$  capacitor charge is refreshed every switching cycle when HS transitions to ground. The boot diode provides fast recovery times, low diode resistance, and voltage rating margin to allow for efficient and reliable operation.

### **Output Stages**

The output stages are the interface to the power MOSFETs in the power train. High slew rate, low resistance and high peak current capability of both output drivers allow for efficient switching of the power MOSFETs. The low-side output stage is referenced from  $V_{DD}$  to  $V_{SS}$  and the high side is referenced from  $V_{HB}$  to  $V_{HS}$ .

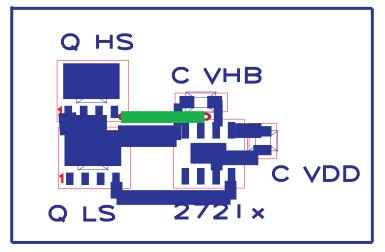

## TEXAS INSTRUMENTS

### Layout Recommendations

To improve the switching characteristics and efficiency of a design, the following layout rules should be followed.

- Locate the driver as close as possible to the MOSFETs.
- Locate the V<sub>DD</sub>-V<sub>SS</sub> and V<sub>HB</sub>-V<sub>HS</sub> (bootstrap) capacitors as close as possible to the device (see example layout below).
- Pay close attention to the GND trace. Use the thermal pad of the DDA and DRM package as GND by connecting it to the VSS pin (GND). The GND trace from the driver goes directly to the source of the MOSFET but should not be in the high current path of the MOSFET(S) drain or source current.
- Use similar rules for the HS node as for GND for the high-side driver.
- For systems using multiple UCC27210 and UCC27211 devices we recommend that dedicated decoupling capacitors be located at V<sub>DD</sub>-V<sub>SS</sub> for each device.
- Care should be taken to avoid VDD traces being close to LO, HS, and HO signals.
- Use wide traces for LO and HO closely following the associated GND or HS traces. 60 to 100-mils width is preferable where possible.
- Use as least two or more vias if the driver outputs or SW node needs to be routed from one layer to another.
  For GND the number of vias needs to be a consideration of the thermal pad requirements as well as parasitic inductance.
- Avoid LI and HI (driver input) going close to the HS node or any other high dV/dT traces that can induce significant noise into the relatively high impedance leads.

Keep in mind that a poor layout can cause a significant drop in efficiency or system malfunction versus a good PCB layout and can even lead to decreased reliability of the whole system.

### **REVISION HISTORY**

#### Changes from Revision A (November, 2011) to Revision B

Changed ordering information notes to reflect corrected part number
---

#### Changes from Revision B (February) to Revision C

•	Changed V <sub>DD</sub> operating current max range of 4.3 to 4.4 in both places.	5
•	Changed Boot voltage operating current max range from 4.0 to 4.2.	5
•	Changed HB to V <sub>SS</sub> quiescent current max range from 0.13 to 1.0.	5
•	Changed HB to V <sub>SS</sub> operating current max range from 0.9 to 1.1.	5
•	Added Input UCC27210/11 (DDA Only) values.	5
•	Added Under-Voltage Lockout (UVLO) DDA only values, two places.	5
•	Changed LO Gate Driver's Low-level output voltage max range from 0.15 to 0.17	5
•	Changed LO Gate Driver's V <sub>LOH</sub> max range from 0.27 to 0.29.	5
•	Changed HO GATE Driver's Low-level output voltage max range from 0.15 to 0.17	5
•	Changed V <sub>LI</sub> falling to V <sub>LO</sub> falling min value from 17 to 15	6
•	Changed $V_{HI}$ falling to $V_{HO}$ falling min value from 17 to 15.	6
•	Changed $V_{LI}$ rising to $V_{LO}$ rising min value from 18 to 15.	6
•	Changed $V_{HI}$ rising to $V_{HO}$ rising min value from 18 to 15.	6
•	Changed Figure 17, Output Current vs. Output Voltage.	12

#### Changes from Revision C (March, 2012) to Revision D

•	Changed capacitor range from 1.0 µF to 4.7 µF.	9
•	Added Terminal Functions Note.	9
•	Changed bullet 2 in the Layout Recommendations.	16
•	Added Note: For systems using	16
•	Added Note: Care should be taken	16

<sup>(1)</sup> The marketing status values are defined as follows: **ACTIVE:** Product device recommended for new designs.

Addendum-Page 1

www.ti.com

#### PACKAGE OPTION ADDENDUM

28-Oct-2012

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect. NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design. PREVIEW: Device has been announced but is not in production. Samples may or may not be available. OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and package, or 2) lead-based die adhesive used between the die and package, or 2) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and package, or 3) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

# PowerPAD<sup>™</sup> PLASTIC SMALL OUTLINE

## THERMAL INFORMATION

This PowerPAD<sup> $\mathbb{N}$ </sup> package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
