W6810

SINGLE-CHANNEL VOICEBAND CODEC

Data Sheet

Publication Release Date: July, 2006
Revision A13

1. GENERAL DESCRIPTION

The W6810 is a general-purpose single channel PCM CODEC with pin-selectable μ-Law or A-Law companding. The device is compliant with the ITU G.712 specification. It operates off of a single +5V power supply and is available in 20-pin PDIP, SOG, SSOP, and TSSOP package options. Functions performed include digitization and reconstruction of voice signals, and band limiting and smoothing filters required for PCM systems. The filters are compliant with ITU G.712 specification. W6810 performance is specified over the industrial temperature range of –40°C to +85°C.

The W6810 includes an on-chip precision voltage reference and an additional power amplifier, capable of driving 300Ω loads differentially up to a level of 6.3V peak-to-peak. The analog section is fully differential, reducing noise and improving the power supply rejection ratio. The data transfer protocol supports both long-frame and short-frame synchronous communications for PCM applications, and IDL and GCI communications for ISDN applications. W6810 accepts seven master clock rates between 256 kHz and 4.096 MHz, and an on-chip pre-scaler automatically determines the division ratio for the required internal clock.

For fast evaluation and prototyping purposes, the W6810DK development kit is available.

2. FEATURES

- Single +5V power supply
- Typical power dissipation of 25 mW, power-down mode of 0.5 μW
- Fully-differential analog circuit design
- On-chip precision reference of 1.575 V for a 0 dBm TLP at 600 Ω (775mV_{RMS})
- Push-pull power amplifiers with external gain adjustment with 300 Ω load capability
- Seven master clock rates of 256 kHz to 4.096 MHz
- Pin-selectable μ-Law and A-Law companding (compliant with ITU G.711)
- CODEC A/D and D/A filtering compliant with ITU G.712
- Industrial temperature range (–40°C to +85°C)
- Four packages: 20-pin PDIP, SOG, SSOP, and TSSOP
- Pb-Free / RoHS package options available

AppIlcations

- Digital Telephone Systems
- Central Office Equipment (Gateways, Switches, Routers)
- PBX Systems (Gateways, Switches)
- PABX/SOHO Systems
- Local Loop card
- SOHO Routers
- VoIP Terminals
- Enterprise Phones
- ISDN Terminals
- Analog line cards
- Digital Voice Recorders

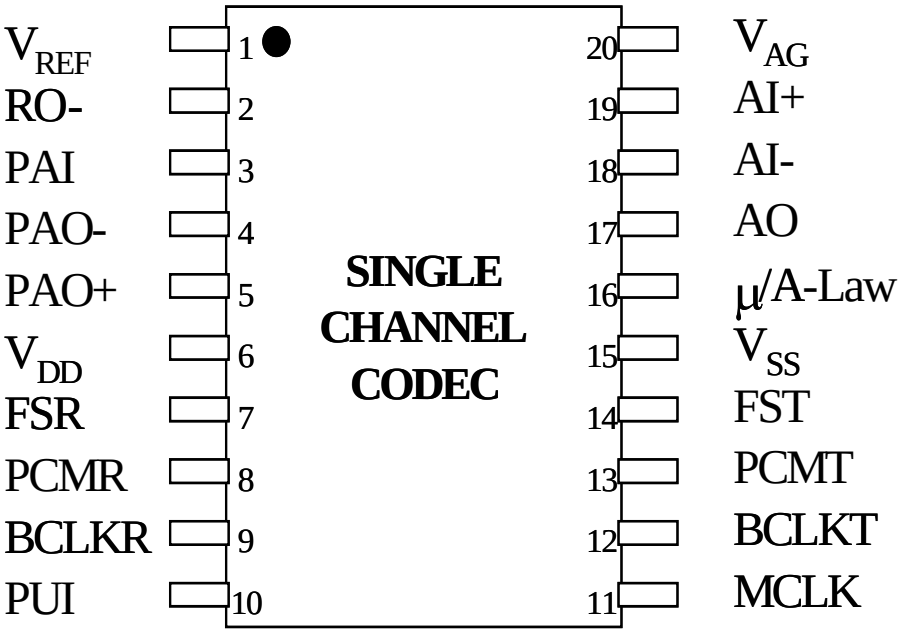
4. TABLE OF CONTENTS

5. PIN CONFIGURATION



PDIP/SOG/SSOP/TSSOP

6. PIN DESCRIPTION

Pin Name	Pin No.	Functionality
V_{REF}	1	This pin is used to bypass the on-chip 2.5V voltage reference. It needs to be decoupled to V_{SS} through a 0.1 μF ceramic decoupling capacitor. No external loads should be tied to this pin.
RO-	2	Inverting output of the receive smoothing filter. This pin can typically drive a 2 kΩ load to 1.575 volt peak referenced to the analog ground level.
PAI	3	This pin is the inverting input to the power amplifier. Its DC level is at the V_{AG} voltage.
PAO-	4	Inverting power amplifier output. This pin can drive a 300 Ω load to 1.575 volt peak referenced to the V_{AG} voltage level.
PAO+	5	Non-inverting power amplifier output. This pin can drive a 300 Ω load to 1.575 volt peak referenced to the V_{AG} voltage level.
V_{DD}	6	Power supply. This pin should be decoupled to V_{SS} with a 0.1μF ceramic capacitor.
FSR	7	8 kHz Frame Sync input for the PCM receive section. This pin also selects channel 0 or channel 1 in the GCI and IDL modes. It can also be connected to the FST pin when transmit and receive are synchronous operations.
PCMR	8	PCM input data receive pin. The data needs to be synchronous with the FSR and BCLKR pins.
BCLKR	9	PCM receive bit clock input pin. This pin also selects the interface mode. The GCI mode is selected when this pin is tied to V_{SS}. The IDL mode is selected when this pin is tied to V_{DD}. This pin can also be tied to the BCLKT when transmit and receive are synchronous operations.
PUI	10	Power up input signal. When this pin is tied to V_{DD}, the part is powered up. When tied to V_{SS}, the part is powered down.
MCLK	11	System master clock input. Possible input frequencies are 256 kHz, 512 kHz, 1536 kHz, 1544 kHz, 2048 kHz, 2560 kHz & 4096 kHz. For a better performance, it is recommended to have the MCLK signal synchronous and aligned to the FST signal. This is a requirement in the case of 256 and 512 kHz frequency.
BCLKT	12	PCM transmit bit clock input pin.
PCMT	13	PCM output data transmit pin. The output data is synchronous with the FST and BCLKT pins.
FST	14	8 kHz transmit frame sync input. This pin synchronizes the transmit data bytes.
V_{SS}	15	This is the supply ground. This pin should be connected to 0V.
μ/A-Law	16	Compander mode select pin. μ-Law companding is selected when this pin is tied to V_{DD}. A-Law companding is selected when this pin is tied to V_{SS}.
AO	17	Analog output of the first gain stage in the transmit path.
AI-	18	Inverting input of the first gain stage in the transmit path.
AI+	19	Non-inverting input of the first gain stage in the transmit path.
V_{AG}	20	Mid-Supply analog ground pin, which supplies a 2.5 Volt reference voltage for all-analog signal processing. This pin should be decoupled to V_{SS} with a 0.01μF capacitor. This pin becomes high impedance when the chip is powered down.

7. FUNCTIONAL DESCRIPTION

W6810 is a single-rail, single channel PCM CODEC for voiceband applications. The CODEC complies with the specifications of the ITU-T G.712 recommendation. The CODEC also includes a complete μ-Law and A-Law compander. The μ-Law and A-Law companders are designed to comply with the specifications of the ITU-T G.711 recommendation.

The block diagram in section 3 shows the main components of the W6810. The chip consists of a PCM interface, which can process long and short frame sync formats, as well as GCI and IDL formats. The pre-scaler of the chip provides the internal clock signals and synchronizes the CODEC sample rate with the external frame sync frequency. The power conditioning block provides the internal power supply for the digital and the analog section, while the voltage reference block provides a precision analog ground voltage for the analog signal processing. The main CODEC block diagram is shown in section 3.

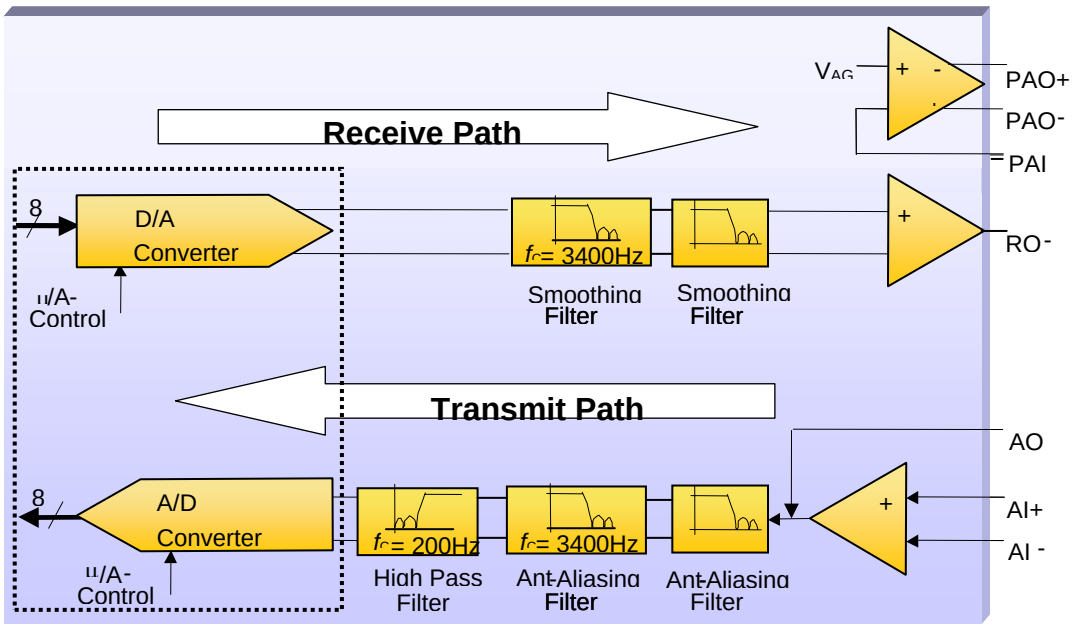


Figure 7.1 The W6810 Signal Path

7.1. Transmit Path

The A-to-D path of the CODEC contains an analog input amplifier with externally configurable gain setting (see application examples in section 11). The device has an input operational amplifier whose output is the input to the encoder section. If the input amplifier is not required for operation it can be powered down and bypassed. In that case a single ended input signal can be applied to the AO pin or the AI- pin. The AO pin becomes high input impedance when the input amplifier is powered down. The input amplifier can be powered down by connecting the AI+ pin to V_{DD} or V_{SS}. The AO pin is selected as an input when AI+ is tied to V_{DD} and the AI- pin is selected as an input when AI+ is tied to V_{SS} (see Table 7.1).

AI+ (Pin 19)	**Input Amplifier**	**Input**
V_{DD}	Powered Down	AO (Pin 17)
1.2 to V_{DD}-1.2	Powered Up	AI+, AI- (Pins 19,18)
V_{SS}	Powered Down	AI- (Pin 18)

Table 7.1 Input Amplifier Modes of operation

When the input amplifier is powered down, the input signal at AO or AI- needs to be referenced to the analog ground voltage V_{AG}.

The output of the input amplifier is fed through a low-pass filter to prevent aliasing at the switched capacitor 3.4 kHz low pass filter. The 3.4 kHz switched capacitor low pass filter prevents aliasing of input signals above 4 kHz, due to the sampling at 8 kHz. The output of the 3.4 kHz low pass filter is filtered by a high pass filter with a 200 Hz cut-off frequency. The filters are designed according to the recommendations in the G.712 ITU-T specification. From the output of the high pass filter the signal is digitized. The signal is converted into a compressed 8-bit digital representation with either μ-Law or A-Law format. The μ-Law or A-Law format is pin-selectable through the μ/A-Law pin. The compression format can be selected according to Table 7.2.

μ/A-Law Pin (Pin 16)	**Format**
V_{SS}	A-Law
V_{DD}	μ-Law

Table 7.2. Pin-selectable Compression Format

The digital 8-bit μ-Law or A-Law samples are fed to the PCM interface for serial transmission at the sample rate supplied by the external frame sync FST.

7.2. Receive Path

The 8-bit digital input samples for the D-to-A path are serially shifted in by the PCM interface and converted to parallel data bits. During every cycle of the frame sync FSR, the parallel data bits are fed through the pin-selectable μ-Law or A-Law expander and converted to analog samples. The mode of expansion is selected by the μ/A-Law pin as shown in Table 7.2. The analog samples are filtered by a low-pass smoothing filter with a 3.4 kHz cut-off frequency, according to the ITU-T G.712 specification. A sin(x)/x compensation is integrated with the low pass smoothing filter. The output of this filter is buffered to provide the receive output signal RO-. The RO- output can be externally connected to the PAI pin to provide a differential output with high driving capability at the PAO+ and PAO- pins. By using external resistors (see section 11 for examples), various gain settings of this output amplifier can be achieved. If the transmit power amplifier is not in use, it can be powered down by connecting PAI to V_{DD}.

7.3. POWER MANAGEMENT

7.3.1. Analog and Digital Supply

The power supply for the analog and digital parts of the W6810 must be 5V +/- 10%. This supply voltage is connected to the V_{DD} pin. The V_{DD} pin needs to be decoupled to ground through a 0.1 μF ceramic capacitor.

7.3.2. Analog Ground Reference Bypass

The system has an internal precision voltage reference which generates the 2.5V mid-supply analog ground voltage. This voltage needs to be decoupled to V_{SS} at the V_{REF} pin through a 0.1 μF ceramic capacitor.

7.3.3. Analog Ground Reference Voltage Outpt

The analog ground reference voltage is available for external reference at the V_{AG} pin. This voltage needs to be decoupled to V_{SS} through a 0.01 μF ceramic capacitor. The analog ground reference voltage is generated from the voltage on the V_{REF} pin and is also used for the internal signal processing.

7.4. PCM INTERFACE

The PCM interface is controlled by pins BCLKR, FSR, BCLKT & FST. The input data is received through the PCMR pin and the output data is transmitted through the PCMT pin. The modes of operation of the interface are shown in Table 7.3.

BCLKR (Pin 9)	**FSR** (Pin 7)	**Interface Mode**
64 kHz to 4.096 MHz	8 kHz	Long or Short Frame Sync
V_{SS}	V_{SS}	ISDN GCI with active channel B1
V_{SS}	V_{DD}	ISDN GCI with active channel B2
V_{DD}	V_{SS}	ISDN IDL with active channel B1
V_{DD}	V_{DD}	ISDN IDL with active channel B2

Table 7.3 PCM Interface mode selections

7.4.1. Long Frame Sync

The Long Frame Sync or Short Frame Sync interface mode can be selected by connecting the BCLKR or BCLKT pin to a 64 kHz to 4.096 MHz clock and connecting the FSR or FST pin to the 8 kHz frame sync. The device synchronizes the data word for the PCM interface and the CODEC sample rate on the positive edge of the Frame Sync signal. It recognizes a Long Frame Sync when the FST pin is held HIGH for two consecutive falling edges of the bit-clock at the BCLKT pin. The length of the Frame Sync pulse can vary from frame to frame, as long as the positive frame sync edge occurs every 125 μsec. During data transmission in the Long Frame Sync mode, the transmit data pin PCMT will become low impedance when the Frame Sync signal FST is HIGH or when the 8 bit data word is being transmitted. The transmit data pin PCMT will become high impedance when the Frame Sync signal FST becomes LOW while the data is transmitted or when half of the LSB is transmitted. The internal decision logic will determine whether the next frame sync is a long or a short frame sync, based on the previous frame sync pulse. To avoid bus collisions, the PCMT pin will be high impedance for two frame sync cycles after every power down state. More detailed timing information can be found in the interface timing section.

7.4.2. Short Frame Sync

The W6810 operates in the Short Frame Sync Mode when the Frame Sync signal at pin FST is HIGH for one and only one falling edge of the bit-clock at the BCLKT pin. On the following rising edge of the bit-clock, the W6810 starts clocking out the data on the PCMT pin, which will also change from high to low impedance state. The data transmit pin PCMT will go back to the high impedance state halfway the LSB. The Short Frame Sync operation of the W6810 is based on an 8-bit data word. When receiving data on the PCMR pin, the data is clocked in on the first falling edge after the falling edge that coincides with the Frame Sync signal. The internal decision logic will determine whether the next frame sync is a long or a short frame sync, based on the previous frame sync pulse. To avoid bus collisions, the PCMT pin will be high impedance for two frame sync cycles after every power down state. More detailed timing information can be found in the interface timing section.

7.4.3. General Circuit Interface (GCI)

The GCI interface mode is selected when the BCLKR pin is connected to V_{SS} for two or more frame sync cycles. It can be used as a 2B+D timing interface in an ISDN application. The GCI interface consists of 4 pins : FSC (FST), DCL (BCLKT), Dout (PCMT) & Din (PCMR). The FSR pin selects channel B1 or B2 for transmit and receive. Data transitions occur on the positive edges of the data clock DCL. The Frame Sync positive edge is aligned with the positive edge of the data clock DCLK. The data rate is running half the speed of the bit-clock. The channels B1 and B2 are transmitted consecutively. Therefore, channel B1 is transmitted on the first 16 clock cycles of DCL and B2 is transmitted on the second 16 clock cycles of DCL. For more timing information, see the timing section, figs. 8.3 and 8.4.

7.4.4. Interchip Digital Link (IDL)

The IDL interface mode is selected when the BCLKR pin is connected to V_{DD} for two or more frame sync cycles. It can be used as a 2B+D timing interface in an ISDN application. The IDL interface consists of 4 pins : IDL SYNC (FST), IDL CLK (BCLKT), IDL TX (PCMT) & IDL RX (PCMR). The FSR pin selects channel B1 or B2 for transmit and receive. The data for channel B1 is transmitted on the first positive edge of the IDL CLK after the IDL SYNC pulse. The IDL SYNC pulse is one IDL CLK cycle long. The data for channel B2 is transmitted on the eleventh positive edge of the IDL CLK after the IDL SYNC pulse. The data for channel B1 is received on the first negative edge of the IDL CLK after the IDL SYNC pulse. The data for channel B2 is received on the eleventh negative edge of the IDL CLK after the IDL SYNC pulse. The transmit signal pin IDL TX becomes high impedance when not used for data transmission and also in the time slot of the unused channel. For more timing information, see the timing section.

7.4.5. System Timing

The system can work at 256 kHz, 512 kHz, 1536 kHz, 1544 kHz, 2048 kHz, 2560 kHz & 4096 kHz master clock rates. The system clock is supplied through the master clock input MCLK and can be derived from the bit-clock if desired. An internal pre-scaler is used to generate a fixed 256 kHz and 8 kHz sample clock for the internal CODEC. The pre-scaler measures the master clock frequency versus the Frame Sync frequency and sets the division ratio accordingly. If the Frame Sync is LOW for the entire frame sync period while the MCLK and BCLK pin clock signals are still present, the W6810 will enter the low power standby mode. Another way to power down is to set the PUI pin to LOW. When the system needs to be powered up again, the PUI pin needs to be set to HIGH and the Frame Sync pulse needs to be present. It will take two Frame Sync cycles before the pin PCMT will become low impedance.

9. ABSOLUTE MAXIMUM RATINGS

9.1. ABSOLUTE MAXIMUM RATINGS

Condition	Value
Junction temperature	150^0C
Storage temperature range	-65^0C to $+150^0$C
Voltage Applied to any pin	(V_{SS} - 0.3V) to (V_{DD} + 0.3V)
Voltage applied to any pin (Input current limited to +/-20 mA)	(V_{SS} – 1.0V) to (V_{DD} + 1.0V)
V_{DD} - V_{SS}	-0.5V to +6V

1. *Stresses above those listed may cause permanent damage to the device. Exposure to the absolute maximum ratings may affect device reliability. Functional operation is not implied at these conditions.*

9.2. OPERATING CONDITIONS

Condition	Value
Industrial operating temperature	-40^0C to $+85^0$C
Supply voltage (V_{DD})	+4.5V to +5.5V
Ground voltage (V_{SS})	0V

Note: Exposure to conditions beyond those listed under Absolute Maximum Ratings may adversely affect the life and reliability of the device.

10. ELECTRICAL CHARACTERISTICS

10.1. GENERAL PARAMETERS

Symbol	Parameters	Conditions	Min (2)	Typ (1)	Max (2)	Units
V_{IL}	Input Low Voltage				0.6	V
V_{IH}	Input High Voltage		2.4			V
V_{OL}	PCMT Output Low Voltage	I_{OL} = 3 mA			0.4	V
V_{OH}	PCMT Output High Voltage	I_{OL} = -3 mA	V_{DD} – 0.4			V
I_{DD}	V_{DD} Current (Operating) - ADC + DAC	No Load		5	8	mA
I_{SB}	V_{DD} Current (Standby)	FST & FSR =V_{ss} ; PUI=V_{DD}		10	100	μA
I_{pd}	V_{DD} Current (Power Down)	PUI= V_{ss}		0.1	10	μA
I_{IL}	Input Leakage Current	V_{SS}<V_{IN}<V_{DD}			+/-10	μA
I_{OL}	PCMT Output Leakage Current	V_{SS}<PCMT<V_{DD} High Z State			+/-10	μA
C_{IN}	Digital Input Capacitance				10	pF
C_{OUT}	PCMT Output Capacitance	PCMT High Z			15	pF

1. *Typical values: T_A = 25°C , V_{DD} = 5.0 V*
2. *All min/max limits are guaranteed by Winbond via electrical testing or characterization. Not all specifications are 100 percent tested.*

10.2. Analog Signal Level and Gain Parameters

V_{DD}=5V ±10%; V_{SS}=0V; T_A=-40°C to +85°C; all analog signals referred to V_{AG};

PARAMETER	SYM.	CONDITION	TRANSMIT (A/D)			RECEIVE (D/A)			UNIT
			MIN.	TYP.	MAX.	MIN.	TYP.	MAX.	
Total Distortion vs. Level Tone (1020 Hz, μ-Law, C-Message Weighted)	$D_{LT\mu}$	+3 dBm0	36	---	---	34	---	---	dBC
		0 dBm0 to -30 dBm0	36	---	---	36	---	---	
		-40 dBm0	29	---	---	30	---	---	
		-45 dBm0	25	---	---	25	---	---	
Total Distortion vs. Level Tone (1020 Hz, A-Law, Psophometric Weighted)	D_{LTA}	+3 dBm0	36	---	---	34	---	---	dBp
		0 dBm0 to -30 dBm0	36	---	---	36	---	---	
		-40 dBm0	29	---	---	30	---	---	
		-45 dBm0	25	---	---	25	---	---	
Spurious Out-Of-Band at RO- (300 Hz to 3400 Hz @ 0dBm0)	D_{SPO}	4600 Hz to 7600 Hz	---	---	---	---	---	-30	dB
		7600 Hz to 8400 Hz	---	---	---	---	---	-40	
		8400 Hz to 100000 Hz	---	---	---	---	---	-30	
Spurious In-Band (700 Hz to 1100 Hz @ 0dBm0)	D_{SPI}	300 to 3000 Hz	---	---	-47	---	---	-47	dB
Intermodulation Distortion (300 Hz to 3400 Hz –4 to –21 dBm0	D_{IM}	Two tones	---	---	-41	---	---	-41	dB
Crosstalk (1020 Hz @ 0dBm0)	D_{XT}		---	---	-75	---	---	-75	dBm0
Absolute Group Delay	τ_{ABS}	1200Hz	---	---	360	---	---	240	μsec
Group Delay Distortion (relative to group delay @ 1200 Hz)	τ_D	500 Hz	---	---	750	---	---	750	μsec
		600 Hz	---	---	380	---	---	370	
		1000 Hz	---	---	130	---	---	120	
		2600 Hz	---	---	130	---	---	120	
		2800 Hz	---	---	750	---	---	750	
Idle Channel Noise	N_{IDL}	μ-Law; C-message	---	---	18	---	---	13	dBrnc0
		A-Law; Psophometric	---	---	-68	---	---	-78	dBm0p

10.4. Analog Input and Output Amplifier Parameters

V_{DD}=5V ±10%; V_{SS}=0V; T_A=-40°C to +85°C; all analog signals referred to V_{AG};

PARAMETER	SYM.	CONDITION	MIN.	TYP.	MAX.	UNIT.
AI Input Offset Voltage	$V_{OFF,AI}$	AI+, AI-	---	---	±25	mV
AI Input Current	$I_{IN,AI}$	AI+, AI-	---	±0.1	±1.0	µA
AI Input Resistance	$R_{IN,AI}$	AI+, AI- to V_{AG}	10	---	---	MΩ
AI Input Capacitance	$C_{IN,AI}$	AI+, AI-	---	---	10	pF
AI Common Mode Input Voltage Range	$V_{CM,AI}$	AI+, AI-	1.2	---	V_{DD}-1.2	V
AI Common Mode Rejection Ratio	$CMRR_{TI}$	AI+, AI-	---	60	---	dB
AI Amp Gain Bandwidth Product	GBW_{TI}	AO, R_{LD}≥10kΩ	---	2150	---	kHz
AI Amp DC Open Loop Gain	G_{TI}	AO, R_{LD}≥10kΩ	---	95	---	dB
AI Amp Equivalent Input Noise	N_{TI}	C-Message Weighted	---	-24	---	dBrnC
AO Output Voltage Range	V_{TG}	R_{LD}=10kΩ to V_{AG} R_{LD}=2kΩ to V_{AG}	0.5 1.0	--- ---	V_{DD}-0.5 V_{DD}-1.0	V
Load Resistance	R_{LDTGRO}	AO, RO to V_{AG}	2	---	---	kΩ
Load Capacitance	C_{LDTGRO}	AO, RO	---	---	100	pF
AO & RO Output Current	I_{OUT1}	0.5 ≤AO,RO-≤ V_{DD}-0.5	±1.0	---	---	mA
RO- Output Resistance	R_{RO-}	RO-, 0 to 3400 Hz	---	1	---	Ω
RO- Output Offset Voltage	$V_{OFF,RO-}$	RO- to V_{AG}	---	---	±25	mV
Analog Ground Voltage	V_{AG}	Relative to V_{SS}	2.429	2.5	2.573	V
V_{AG} Output Resistance	R_{VAG}	Within ±25mV change	---	2.5	12.5	Ω
Power Supply Rejection Ratio (0 to 100 kHz to V_{DD}, C-message)	PSRR	Transmit Receive	30 30	80 75	--- ---	dBC
PAI Input Offset Voltage	$V_{OFF,PAI}$	PAI	---	---	±20	mV
PAI Input Current	$I_{IN,PAI}$	PAI	---	±0.05	±1.0	µA
PAI Input Resistance	$R_{IN,PAI}$	PAI to V_{AG}	10	---	---	MΩ
PAI Amp Gain Bandwidth Product	GBW_{PI}	PAO- no load	---	1000	---	kHz
Output Offset Voltage	$V_{OFF,PO}$	PAO+ to PAO-	---	---	±50	mV
Load Resistance	R_{LDPO}	PAO+, PAO- differentially	300	---	---	Ω
Load Capacitance	C_{LDPO}	PAO+, PAO- differentially	---	---	1000	pF

PARAMETER	SYM.	CONDITION	MIN.	TYP.	MAX.	UNIT.
PO Output Current	I_{OUTPO}	0.5 ≤AO,RO-≤ V_{DD}-0.5	±10.0	---	---	mA
PO Output Resistance	R_{PO}	PAO+ to PAO-	---	1	---	Ω
PO Differential Gain	G_{PO}	R_{LD}=300Ω, +3dBm0, 1 kHz, PAO+ to PAO-	-0.2	0	+0.2	dB
PO Differential Signal to Distortion C-Message weighted	D_{PO}	Z_{LD}=300Ω Z_{LD}=100nF + 100Ω Z_{LD}=100nF + 20Ω	45 --- ---	60 40 40	--- --- ---	dBC
PO Power Supply Rejection Ratio (0 to 25 kHz to V_{DD}, Differential out)	$PSRR_{PO}$	0 to 4 kHz 4 to 25 kHz	40 ---	55 40	--- ---	dB

10.5. DIGITAL I/O

10.5.1. μ-Law Encode Decode Characteristics

Normalized Encode Decision Levels	Digital Code								Normalized Decode Levels
	D7	D6	D5	D4	D3	D2	D1	D0	
	Sign	Chord	Chord	Chord	Step	Step	Step	Step	
8159	1	0	0	0	0	0	0	0	8031

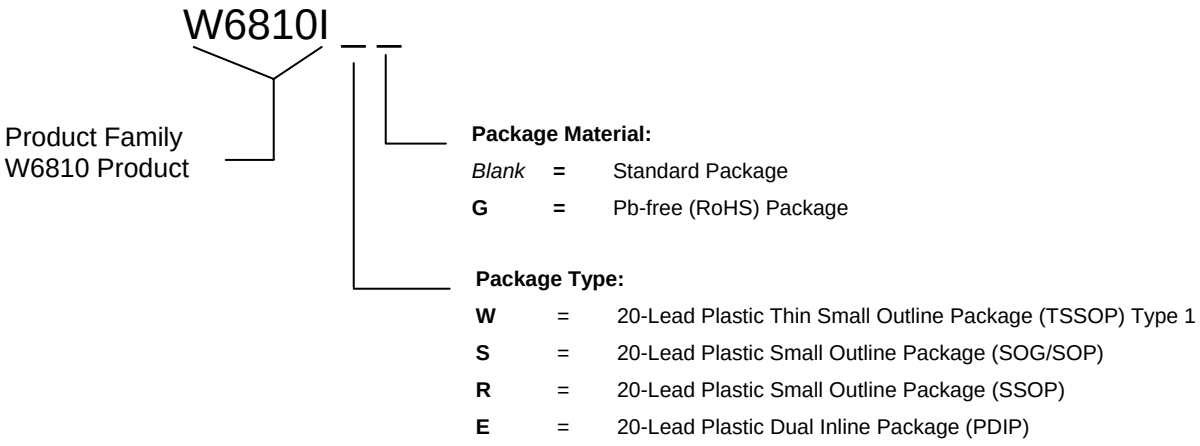
13. ORDERING INFORMATION

Winbond Part Number Description



When ordering W6810 series devices, please refer to the following part numbers.

Part Number
W6810IW
W6810IS
W6810IR
W6810IE
W6810IWG
W6810ISG
W6810IRG
W6810IEG

14. VERSION HISTORY

VERSION	DATE	PAGE	DESCRIPTION
A9	Oct, 2002		First Release
A10	April 2005	37	Add Important Notice
A11	July 2005	2	Added reference to Pb-free RoHS packaging and to V_{RMS}
		9, 10	Added Pin numbers to Tables
		11, 12	Capitalized logic HIGH/LOW
		22	Extended conditions on Table 10.2. Added Reference to V_{RMS}
		23	Extended conditions on Table 10.3. Corrected Idle Channel Noise min/max and units.
		29, 30	Improved Application Diagram
		35	Added G package ordering code
A12	September, 2005	29, 30	Improved Application Diagrams
A13	July, 2006	29, 30	Improved Application Diagrams

Important Notice

Winbond products are not designed, intended, authorized or warranted for use as components in systems or equipment intended for surgical implantation, atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, or for other applications intended to support or sustain life. Further more, Winbond products are not intended for applications wherein failure of Winbond products could result or lead to a situation wherein personal injury, death or severe property or environmental damage could occur.

Winbond customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Winbond for any damages resulting from such improper use or sales.

The information contained in this datasheet may be subject to change without notice. It is the responsibility of the customer to check the Winbond USA website (www.winbond-usa.com) periodically for the latest version of this document, and any Errata Sheets that may be generated between datasheet revisions.
